              mailto:est@watson.wustl.edu

              NOTICE:  This sequence represents the full insert of this cDNA.  No
              attempt has been made to verify whether this corresponds to the
              full-length of the original mRNA from which it was derived.  We
              have tried to obtain double-stranded, or double chemistry sequence
              across the entire clone, but potentially, there are areas in the
              sequence where this level of coverage was not achieved.
              Nevertheless, we are confident of the accuracy of this sequence as
              all regions of low quality, as defined by PHRAP (P. Green, in
              preparation), were visually inspected and edited accordingly.  The
              consensus quality values for this sequence have been submitted
              separately.

              The location of this clone is unknown.

COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=T01C3
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone T01C3.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone T01C3 is at 1 in this sequence. The true
            right end of clone T01C3 is at 10399 in
            sequence Z81061.
            The true left end of clone F14H8 is at 23107 in this sequence. The
            true right end of clone F02D8 is at 12022 in this sequence. The
            start of this sequence (1. .104) overlaps with the end of sequence
            Z78411.
            The end of this sequence (23107. .23210) overlaps with the start of
            sequence Z81061.

COMMENT Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other available information.
For a graphical representation of this sequence and its analysis see:-
http://webace.sanger.ac.uk/cgi-bin/display?db=wormace&class=Sequence &object=T07F10
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
IMPORTANT: This sequence is not the entire insert of clone T07F10. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
The true left end of clone T07F10 is at 1 in this sequence. The true right end of clone T07F10 is at 10934 in sequence Z75548.
The true left end of clone R90 is at 17787 in this sequence. The

true right end of clone C44H9 is at 2700 in this sequence. The start of this sequence (1. .109) overlaps with the end of sequence Z75529.
The end of this sequence (26845. .26969) overlaps with the start of sequence Z75548.

  COMMENT     Notes:
              Details of yeast sequencing at the Sanger Centre are available on
              the World Wide Web.
              (URL, http://www.sanger.ac.uk/Projects/S_pombe/)
              During 1995 to 1996 about 80% of S. pombe chromosome 1 was
              sequenced by the Sanger Centre.  The sequencing of the S. pombe
              genome is now being continued with funding from The European
              Commission. Fourteen European sequencing laboratories, including
              the Sanger Centre, are participating in the project.
              Protein coding regions (CDS) have been predicted with the help of
              computer analysis using the Genefinder program in PomBase (an ACEDB
              database) with additional predictions for the branch-acceptor sites
              supplied by the program Sp3splice. CAUTION: It is possible that for
              any individual CDS we may have underestimated or overestimated the
              number of introns/exons or we may not have chosen the correct
              splice donor/acceptor sites. CDS are numbered using the following
              system eg SPBC25H2.01c. SP (S. pombe), B (chromosome 2), c25H2
              (cosmid name), .01 (first CDS), c (complementary strand).
              The more significant matches with motifs in the PROSITE database
              are also included but some of these may be fortuitous. The length
              in codons is given for each CDS.
              IMPORTANT: This sequence MAY NOT be the entire insert of the
              sequenced clone.  It may be shorter because we only sequence
              overlapping sections once, or longer, because we arrange for a
              small overlap between neighbouring submissions. Cosmid c553 is
              overlapped at the 5' end by cosmid 794 and at the 3' end by cosmid
              736.

            Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=B0240
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone B0240.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone B0240 is at 1 in this sequence. The true
            right end of clone B0240 is at 11447 in
            sequence Z72513.
            The true left end of clone T04F3 is at 32236 in this sequence. The
            true right end of clone W05E10 is at 1829 in this sequence. The
            start of this sequence (1. .106) overlaps with the end of sequence
            Z77670.
            The end of this sequence (32236. .32346) overlaps with the start of
            sequence Z72513.

MEDLINE 92168156
REFERENCE 2 (bases 1 to 36087)
AUTHORS Du,Z. and Waterston,R.
TITLE Sequence of the C. elegans cosmid ZC21
JOURNAL Unpublished (1993)
COMMENT Submitted by:
Nematode Sequencing Project
Department of Genetics, Washington University,
St. Louis, MO 63110, USA, and
MRC Laboratory of Molecular Biology,
Cambridge CB2 2QH, England
e-mail: rw@nematode.wustl.edu and jes@cele.mrc-lmba.cam.ac.uk NOTE:
Coding sequences below are predicted from computer analysis, using the program Genefinder (P. Green and L. Hillier, in preparation)
Neighboring cosmid information:
This sequence is the entire sequence of C. elegans cosmid ZC21.
Bases 1 to 200 of this cosmid correspond to bases 10234 to 10433 of the C. elegans cosmid C04D8 entry (GenBank: L16687). Bases 1 to 200 of the GenBank entry for cosmid C02D5 (GenBank: CELC02D5) correspond to bases 35888 to 36087 of this entry.
The end of the actual sequence of the C04D8 cosmid is at 7298 of this entry.
The beginning of the actual C02D5 cosmid sequence is at 22573 of this entry.
The beginning of the actual K10C7 cosmid sequence is at 30071 of this entry.

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University,
                  St. Louis, MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 1RQ, England
                  e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
```

It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

The 5' end of this cosmid lies in a gap;3' cosmid is C52A10, 200 bp overlap. Actual start of this cosmid is at base position 1 of CELB0238; actual end is at 41754 of CELB0238. This cosmid lies in an unanchored cluster, the orientation of which is unknown.

NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation).

Genome Sequencing Center
Department of Genetics, Washington University,
St. Louis, MO 63110, USA, and
Sanger Centre, Hinxton Hall
Cambridge CB10 1RQ, England
e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

The 5' cosmid is W03A6, 200 bp overlap;3' cosmid is Y48A5B, 200 bp overlap. Actual start of this cosmid is at base position 1 of CELF55A8; actual end is at 45131 of CELF55A8

NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation).

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
```

```
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project and the Washington University Genome Sequencing Center.
            For additional information about the map position of this sequence,
            see http://www.nhgri.nih.gov/DIR/GTB/CHR7 or
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-5, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is DJ1090P18, 200 bp overlap. The
            actual start of this clone is at base position 1 of DJ0841B21;
            actual end is at 74918 of DJ0841B21. The orientation of this clone
            unknown.

            This clone contains STS sWSS30 (NID:g1254687).

            BAC clone F18A8 is from Arabidopsis chromosome II and close to the
            molecular marker B68.
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of three methods: Gene
            prediction programs including GRAIL (available by anonymous ftp
            from arthur.epm.ornl.gov), Genefinder (Phil Green, University of
            Washington), Genscan (Chris Burge,
            http://gnomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene
            (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the
            complete sequence against a peptide database and the Arabidopsis
            EST database at TIGR (http://www.tigr.org/tdb/at/at.html).
            Annotated genes are named to indicate the level of evidence for
            their annotation. Genes with similarity to other proteins are named
            after the database hits. Genes without significant peptide
```

```
            similarity but with EST similarity are named as 'unknown' proteins.
            Genes without protein or EST similarity, that are predicted by more
            than two gene prediction programs over most of their length are
            annotated as 'hypothetical' proteins. Genes encoding tRNAs are
            predicted by tRNAscan-SE (Sean Eddy,
            http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are
            identified by repeatmasker (Arian Smit,
            http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of
            genomic sequence that are not annotated as genes but have predicted
            exons by GRAIL are annotated as misc features.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
```

sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:
This clone was derived from human PAC library RPCI-5, prepared by Pieter de Jong and coworkers at Roswell Park Cancer Institute, using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one male donor. For further details, see http://bacpac.med.buffalo.edu/
The clone is available from Genome Systems, Inc. (http://www.genomesystems.com).
VECTOR: pCYPAC2
NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the right is DJ0608H12, 200 bp overlap. Actual start of this clone is at base position 1 of DJ1182N03; actual end is at 17513 of DJ0608H12.

COMMENT     On Oct 9, 1998 this sequence version replaced gi:3717969.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ19408  Contig_ID: 01485  acc=AL031769
            Length: 22324 bp Unfinished: dJ19408  Contig_ID: 00001

KEYWORDS    EST.
SOURCE      human clone=233666 primer=M13RP1 library=Soares fetal liver spleen
            1NFLS vector=pT7T3D (Pharmacia) with a modified polylinker
            host=DH10B (ampicillin resistant) Rsite1=Pac I Rsite2=Eco RI Liver
            and spleen from a 20 week-post conception male fetus. 1st strand
            cDNA was primed with a Pac I - oligo(dT) primer [5'
            AACTGGAAGAATTAATTAAAGATCTTTTTTTTTTTTTTTT 3'], double-stranded
            cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Pac
            I and cloned into the Pac I and Eco RI sites of the modified pT7T3
            vector.  Library went through one round of normalization. Library
            constructed by Bento Soares and M.Fatima Bonaldo.

                      /note="Vector: pSPORT1; Site_1: SalI; Site_2: NotI; RNA
                      was prepared from a pool of 6 anonymous Wilms' tumor RNAs.
                       RNA was prepared by acid-phenol, followed by one round of
                      oligo dT selection.  cDNA library preparation was with
                      the BRL/Life Tech. Superscript Plasmid system.  An
                      oligo-dT NotI primer for first strand synthesis generated
                      gcggccgccc(t)n at the 3' end of the clones.  A 5' SalI
                      adaptor was used  with sequence 5'-gtcgacccacgcgtccg-3'.
                      Resulting cDNAs were size selected (average size 2 kb),
                      NotI digested, and ligated into NotI/SalI-cut pSPORT1.
                      Library was constructed by Dr. Manfred Gessler."

Statistics: Mean 6.106; Variance 3.097; scale 1.971

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT    Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT    for diagnosis of abnormal cell function, by preparing cDNA that
PT    reflects relative abundance of corresp. mRNA in specific human
PT    tissues
PS    Claim 1; Page 612; 2245pp; Japanese.
CC    A single-stranded DNA (or its complementary strand or the corresp.
CC    double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC    given in T19001-T26837 and which is able to hybridise to part of
CC    human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC    sequences were obtained from 3'-directed cDNA libraries prepared
CC    from various human tissues; synthesis of cDNA was initiated from the
CC    3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC    untranslated sequence is unique to a particular mRNA species, almost
CC    all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC    is constructed so as to reflect accurately the relative abundance of
CC    different mRNAs in the particular tissue from which it was derived.
CC    The appearance frequency of a given GS in a cDNA library can be
CC    determined (esp. using primers and probes derived from the GS
CC    sequences) as a means of diagnosing abnormal cell function or for
CC    recognising different cell types.

PT    Production of recombinant steroid 5alpha-reductase enzyme - by
PT    culturing cell containing DNA encoding the enzyme
PS    Example 8; Columns 67-70; 70pp; English.
CC    This sequence represents the DNA encoding a pseudogene of human steroid
CC    5alpha-reductase, termed SRD5AP1. The encoded enzyme can be produced by
CC    the method of the invention. The method is for producing a steroid
CC    5alpha-reductase, and comprises preparing a recombinant host cell
CC    containing a DNA segment encoding a steroid 5alpha-reductase and
CC    culturing the cell under conditions such that the steroid
CC    5alpha-reductase is produced by the cell. The steroid 5alpha-reductase
CC    produced by the method is used for identifying substances that affect the
CC    enzymatic activity of steroid 5alpha-reductase. Substances identified as
CC    inhibiting steroid 5alpha-reductase activity can be used for inhibiting
CC    the conversion of testosterone.

PT   New isolated plant cytochrome P450-type hydroxylase gene - used to
PT   identify substances acting as brassino-steroid(s) or brassinosteroid
PT   inhibitors for the production of modified plants
PS   Claim 1; Pages 48-53; 77pp; English.
CC   The present sequence encodes Arabidopsis thaliana cytochrome
CC   P450-type hydroxylase. The hydroxylase can be used to identify
CC   brassinosteroids or brassinosteroid inhibitors, useful to produce
CC   plants with modified physiological and/or phenotypic
CC   characteristics. The modified plants may show, e.g. stimulation of
CC   growth, increased cell elongation, increased wood production,
CC   accelerated seed germination at low temperatures, an increase in
CC   dry weight, repressed anthocyanin production during growth in light
CC   and/or inhibited de-etiolation which is induced, e.g. by cytokinin,
CC   in the dark or an increase in stress tolerance. The hydroxylase or
CC   its coding sequence can also be used for the recombinant production
CC   of compounds, e.g. teasterone.

PT   Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat
PT   pc5 - involved in cell-cell adhesion and regulation activities
```

```
PS   Example 2; Page 63; 146pp; English.
CC   T03600-T03612 represent partial cDNA clones of the human protocadherin
CC   sequence.  These sequences were isolated after screening a human brain
CC   cDNA preparation with the primers shown in T03575 and T03576.  The
CC   primers were constructed from portions of the amino acid sequences of the
CC   third and fourth extracellular domains of published cadherin sequences.
CC   The full length cDNA sequences encoding human protocadherins pc3 and pc4
CC   are represented by T03572 and T03573, respectively.  The cytoplasmic
CC   domain of cadherin interacts with the cytoskeleton through catenins and
CC   other cytoskeleton associated proteins.  The cytoplasmic domain is not
CC   present in all cadherins, but in those which possess it, it is essential
CC   for the cadherins adhesive function.  The cadherins which do not possess
CC   a cytoplasmic domain appear to function via a different method from those
CC   with a cytoplasmic domain.  The proteins encoded by these sequences are
CC   involved in cell-cell adhesion.  The proteins may have regulatory
CC   functions in the cell, as well as the cell-cell adhesive properties.
CC   Antibodies produced against the encoded sequences are useful for
CC   modulating the binding activity of these protocadherins, and can be used
CC   therapeutically.

PT   Polynucleotide sequences encoding new proto:cadherins - useful
PT   for modulating natural binding and regulating activities.
PS   Example; Page 59; 114pp; English.
```

```
CC   Two regions of conserved AA sequence, one from the middle of the
CC   third cadherin extracellular subdomain (EC-3) and the other from the
CC   C-terminus of the fourth extracellular subdomain (EC-4) were
CC   identified. The corresp. degenerate oligos (Q68949, Q68950) were
CC   designed for use as PCR primers. PCR was carried out on a rat brain
CC   cDNA prepn. Two major bands of about 450 bps and 130 bps were found.
CC   The 450 bp band corresponded to the expected length between the two
CC   primer sites, but the 130 bp band could not be predicted from any
CC   of the previously identified cadherin sequences. The 450 bp and 130
CC   bp bands were extracted and sequenced. Nineteen novel partial cDNA
CC   clones were isolated. The DNA and deduced AA sequences of the
CC   clones (including sequences corresp. to the PCR primers) are given
CC   in Q68951-Q68969 and R58860-R58878. Various cDNA fragments
CC   structurally similar to the rat cDNAs were isolated from human,
CC   mouse and Xenopus brain cDNA prepns. and from Drosophila and
CC   C. elegans whole body cDNA prepns. by PCR using the above primers.
CC   The DNA and deduced AA sequences of the resulting PCR fragments
CC   (including sequences corresp. to the PCR primers) are given in
CC   Q68971, Q68972-Q68994 and R58882-R58905 and R49143. Comparison
CC   of the deduced AA sequences indicates a similarity, in particular,
CC   there are three sets of clones that appear to be cross-species
CC   homologues: RAT-218, MOUSE-322 and HUMAN-43; RAT-314, MOUSE-321 and
CC   HUMAN-11; and MOUSE-326 and HUMAN-42.

PT   New peptide(s) from bacterial pyrrolidone carboxyl:yl peptidase -
PT   for prodin. of antibodies, DNA transformed cells etc., useful e.g.
PT   for detecting specific pathogens
PS   Claim 8; Fig 5; 37pp; French.
CC   The pcp gene coding for the PYRase of Bacillus subtilis was
CC   isolated from a B.subtilis gene library. The amino acid sequence
CC   deduced from the coding region has 47.5% identity to the PYRase
CC   from S.pyogenes and more than 66% homology to it. Antibodies to
CC   the regions which are highly conserved between the PYRases of
CC   different bacteria can be used to detect any PCP-producing species.

PT   Helicobacter pylori nucleic acid sequences and encoded
PT   polypeptide(s) - useful in vaccines to treat or prevent H. pylori
PT   infection and for diagnosis of H. pylori infection
PS   Claims 5,6; Page 239; 1145pp; English.
CC   This sequence encodes a H. pylori protein of unspecified function.
CC   The protein may be used in a vaccine to prevent or treat H. pylori
CC   infection or to identify H. pylori polypeptide binding compounds,
CC   useful as potential H. pylori life cycle activators or inhibitors. The
CC   DNA and probes derived from it may be used for the identification of
CC   H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic
CC   acid sequences complementary to the DNA act as antisense sequences and
CC   can be used to prevent the translation of H. pylori mRNA. Antibodies
CC   against the protein can be used in immunoassays to evaluate the abundance
CC   and distribution of H. pylori-specific antigens. The genomic sequence of
CC   H. pylori (ATCC 55679) was determined from overlapping contigs generated
```

```
CC   by mechanically shearing the bacterial DNA. The sequences were analysed
CC   for ORF of at least 180 nucleotides, and the predicted coding regions
CC   defined by computer evaluation. To identify likely H. pylori antigens for
CC   vaccine development, the amino acid sequences predicted from various ORF
CC   were analysed for significant homology to other known or exported
CC   membrane proteins. Having identified and determined the sequences of
CC   interest, particular regions can be isolated from H. pylori by PCR
CC   amplification for recombinant polypeptide production, e.g. in E. coli
CC   hosts.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1250; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   New isolated ataxia-telangiectasia gene - used to develop prods. for
PT   the study, diagnosis and treatment of ataxia-telangiectasia.
PS   Claim 1; Page 71; 153pp; English.
CC   T43444-T43496 represent exons of the ATM gene of the invention.
CC   Ataxia-telangiectasia (A-T) is caused by mutations, insertions, or
CC   deletions in the coding region of the ATM gene. A-T is a progressive
CC   genetic disorder affecting the central nervous and immune systems. A-T
CC   involves chromosomal instability, cancer predisposition, radiation
CC   sensitivity, and cell cycle abnormalities. A-T is a multi-system disease
CC   inherited in an autosomal recessive manner. Cerebellar ataxia that
CC   gradually develops into general motor dysfunction is the first clinical
CC   hallmark of A-T, and results from progressive loss of Purkinje cells in
CC   the cerebellum. Oculocutaneous telangiectasia (dilation of blood vessels)
CC   develops in the bulbar conjunctiva and facial skin, and is later
CC   accompanied by graying of the hair and atrophic changes in the skin. The
CC   co-occurrence of cerebellar ataxia and telangiectases in the conjunctivae
CC   and occasionally on the facial skin (the second early hallmark of A-T)
CC   usually establishes the differential diagnosis of A-T from other
CC   cerebellar ataxias. The ATM gene, can be used in methods for detecting
CC   carriers of a defective gene that causes A-T. The gene can also be used
CC   to generate antibodies. The antibodies and methods can be used in the
CC   study, diagnosis and therapy of A-T.

PT   Gene for cyclodextrin glycosyltransferase - used for transforming
PT   plants for prodn. of starch cyclodextrin cpds., while minimising
PT   degradation
PS   Example; Fig 2; 68pp; English.
CC   A binary vector, pCGN2160b, was constructed contg. the patatin-5'
CC   region for Solanum tuberosum var Kennebec, DNA encoding a transit
CC   peptide from soybean RuBisCo SSU protein, 48 bp of DNA encoding 16
CC   AAs of mature RuBisCo SSU protein from pea, the cyclodextrin
CC   glycosyltransferase (CGT) coding region from K. pneumoneae and the
CC   nos-3'-region.A.tumefaciens strain 2760 was transformed with
CC   pCGN2160b and the transformants were co-cultivated with Solanum
CC   tuberosum var. Russet Burbank tuber discs to produce transformed
CC   plants.  The transformed plants were grown and  cyclodextrin (CD)
CC   was isolated from tubers.

PT   Antigen for producing transmission blocking antibodies against
PT   malaria - obtd. by expressing recombinant PPS25 Plasmodium
PT   falciparum protein in yeast cells
PS   Disclosure; columns 9-10; 10pp; English.
CC   Pfs25 contains a putative signal sequence at the amino terminus and
CC   a short hydrophobic anchor at the carboxyl terminus. These regions
CC   are identified by the hydrophobic regions noted in FT. The inventors
CC   have engineered, by chemical synthesis and mutagenesis, a gene
CC   expressible in yeast cells which produces an analogue of Pfs25,
CC   designated Pfs25-B. Absent from the yeast-expressed protein was the
CC   amino-terminal secretory sequence and the hydrophobic carboxyl
CC   terminal region. The N-linked glycosylation sites were also removed.
CC   Pfs25-B was shown to react with conformation dependent MAbs despite
CC   its conformational changes. In addition it elicited transmission-
CC   blocking activity in mice and monkeys. The DNA segment encoding
CC   Pfs25-B is operably linked to a vector, e.g., pBS24-Pfs25-B.

PT   Autographa californica nuclear polyhedrosis virus complete genome
PT   sequence  - useful in the prodn. of vectors for enhanced
PT   heterologous protein expression, such as interleukin(s),
PT   interferon(s) and neurotoxin(s).
PS   Claim 4; Page 90-186; 122pp; English.
CC   T13636-731 show open reading frames 13, 20, 22-30, 32, 38, 41-46, 50-60,
CC   62-63, 66, 68-79, 81-87, 91-92, 96-98, 101-103, 106-127, 129-130, 140-
CC   146, 148-150, 152 and 154 from a total of 154 ORFs identified in the
CC   Autographa californica nuclear polyhedrosis virus (AcNPV) clone 6. Each
CC   gene is numbered according to its position in the virus genome beginning
CC   at the left end of the linear map, and irrespective of its orientation.
CC   The direction of transcription is relative to that of the polyhedrin
CC   gene. Of the 154 ORFs identified it was found that some of the ORFs (ORFs
CC   27, 30, 32, 71, 86, 123, 126 and 127) are dispensable for virus
CC   replication in cell culture or insect larvae.  These genes can be deleted
CC   from the genome to: (a) provide additional sites for inserting single or
CC   multiple copies of foreign genes; and (b) to reduce the size of the virus
CC   genome. The present sequence ORF 27 is on the same strand as the
CC   polyhedrin gene. ORF 27 is referred to as ORF 13 in literature by other
CC   authors.  The gene encodes a potential apoptosis inhibitory protein
CC   (IAP1) contg. at least 1 potential zinc finger.

PT   Transgenic starch producing organism - comprises exogenous ADP
PT   glucose pyrophosphorylase enzyme DNA sequence
PS   Claim 18; Fig 17; 88pp; English.
CC   Q78150 is a 1.8 kb cDNA fragment encoding the small subunit ADP-
CC   glucose pyrophosphorylase from barley endosperm. For the construction of
CC   plasmid pPPS1, a 1.8 kb EcoRI-HindIII cDNA fragment encoding the barley
CC   endosperm AGP small subunit (beps) was cloned i n the BamHI site of
CC   plasmid pPATA1. Plasmid pPATA 1 is a deriv. of a plasmid pUC19 and
CC   has tuber specific patatin class I promoter (Q78152), a polylinker
CC   cloning region, and a 35S terminator. From the resulting plasmid
CC   the 3.1 kb KpnI fragment contg. the patatin promoter, the beps cDNA,
CC   and the 35S terminator was isolated and inserted in the KpnI site of
CC   the plant transformation vector pBKL4 to yield plasmid pPPS1, which
CC   is claimed. The patating promoter (Q78152) is a tuber specific
CC   promoter from potato (Mignery et al. 1988, Gene 62:27-44).

PT   Quantitative nucleic acid amplification - by competitor primer
PT   asymmetric polymerase chain reaction
PS   Example 1; Columns 7-10; 9pp; English.
CC   In a specific example of a novel process for amplifying an amount
CC   (known or unknown) of a double-stranded nucleic acid segment to produce
CC   single-stranded nucleic acid in an amount that is proportional to the
CC   starting amount of the nucleic acid, this Staphylococcus aureus
CC   exfoliative toxin A (ETA) gene was used as the DNA template. The
CC   region comprising nucleotides 165-436 was amplified by symmetric,
CC   asymmetric or competitor primer asymmetric PCR using the primers
CC   ETA-A2 and ETA-B (see T76778 and T76779). For asymmetric PCR, the
CC   amount of primer ETA-B was reduced and for competitor primer
CC   asymmetric PCR a competitor primer ETA-B2 (see T76780) was added
CC   with upstream primer ETA-A2 after the initial cycling reaction. PCR
CC   products containing ETA-specific sequences were detected
CC   radioactively by a capture system which employed a bifunctional
CC   capture probe ETA-CP (see T76781 and T76782). ETA-CP was designed
CC   to capture the amplified sense strand onto capture membranes
CC   through hybridisation between the first 40 nucleotides of ETA-CP
CC   and nucleotides 321-360 of the ETA gene and through hybridisation
CC   of the poly(dA) tail on ETA-CP with poly(dT) tails on the capture
CC   membranes. A radioactively labelled "label probe" (see T76783),
CC   complementary to nucleotides 389-410 of the ETA gene was used to
CC   detect the amplicons. Results showed that hybridisation of the
CC   capture probe and label probe to the denatured symmetric PCR
```

```
CC   product was much less efficient than hybridisation to the
CC   single-stranded PCR products of the asymmetric and competitor
CC   primer asymmetric reactions.

PT   New isolated ataxia-telangiectasia gene - used to develop prods. for
PT   the study, diagnosis and treatment of ataxia-telangiectasia.
PS   Claim 5; Page -; 153pp; English.
CC   T68731-T68785 represent mutations of the ATM gene of the invention (see
CC   T43497 for wild type sequence). The ATM gene of the invention, is located
CC   in the human genome at chromosome segment 11q22-23. Ataxia-telangiectasia
CC   (A-T) is caused by mutations, insertions, or deletions (such as
CC   represented by this sequence) in the coding region of the ATM gene. A-T
CC   is a progressive genetic disorder affecting the central nervous and
CC   immune systems. A-T involves chromosomal instability, cancer
CC   predisposition, radiation sensitivity, and cell cycle abnormalities. A-T
CC   is a multi-system disease inherited in an autosomal recessive manner. The
CC   wild type gene, can be used in methods for detecting carriers of a
CC   defective gene that causes A-T. The gene can also be used to generate
CC   antibodies. The methods and antibodies can be used in the study,
CC   diagnosis and therapy of A-T.

PT   Highly sensitive detection of mycoplasma - by detecting region of
PT   restriction enzyme map and amplifying DNA sequence
PS   Disclosure; Fig 3; 10pp; Japanese.
CC   The sequence is a 1807bp fragment of M. hyopneumoniae and was used
CC   to test a kit for the detection of pig mycoplasma. The DNA is first
CC   amplified by PCR and then the probe is used to detect the amplified
CC   DNA. This method is highly sensitive. See also Q20243-Q20245 and
CC   Q21024-Q21027.

PT   Helicobacter pylori blood group antigen binding adhesin protein -
PT   that binds fucosylated blood group antigen, useful to diagnose,
PT   prevent and treat H. pylori infection
PS   Claim 13; Page 34-36; 51pp; English.
CC   This DNA sequence comprises the Helicobacter pylori CCUG 17875
CC   babb gene that codes for a blood group antigen binding (Bab)
CC   adhesin (see W41523).  The Babb adhesin was isolated using a novel
CC   technique, receptor activity directed affinity tagging (retagging).
CC   The N-terminal 20 amino acids (see W41521) of the isolated protein
CC   was used to design degenerate primers that were used to isolate
CC   the babb gene.  A baba gene (see V04154) was also isolated.  The
```

```
CC   bab genes can be used in the recombinant production of Bab
CC   adhesins.  The Bab adhesins and DNA can be used in the
CC   diagnosis, treatment and/or prophylaxis of H. pylori induced
CC   infections such as gastritis and acid peptic disease, e.g. by
CC   active immunisation.

PT   Truncated receptor tyrosine kinase CCK-2 - and nucleic acid coding
PT   for it, useful for cancer diagnosis
PS   Claim 9; Fig 3; 70pp; English.
CC   The present sequence represents the cDNA sequence of human CCK-2, a
CC   member of the mammary carcinoma kinase 10 (MCK-10, T93785) family of
CC   receptor tyrosine kinases. Expression of CCK-2 is associated with
CC   proliferative diseases such as cancer. The CCK-2 gene was identified by
CC   PCR and a cDNA prepared from colonic adenocarcinoma RNA. CCK-2 is
CC   expressed in a wide variety of cancer cell lines and tumour tissue. The
CC   CCK-2 nucleic acids can be used for diagnostic purposes to detect
CC   aberrant expression of CCK-2 genes. Engineered cell lines, containing
CC   recombinant vectors with the present sequence, are useful for producing
CC   infectious retroviral particles. The cell lines may also be used to
CC   evaluate and screen drugs involved in CCK-2 activation and regulation.

PT   Probe from tyrosine-phosphorylated portion of receptor tyrosine
PT   kinase - used for detection of proteins capable of binding to
PT   receptors, useful for e.g. identifying susceptibility to cancer
PT   and diabetes
PS   Claim 21; Fig 4; 86pp; English.
CC   The GRB-1 coding sequence was isolated from human brain stem lambda
CC   gt11 expression library by screening with tyrosine phosphorylated
CC   C-terminal tail of the EGF Receptor. An initial clone contained a
CC   900bp insert encoding an SH2 domain. Probes were derived from the
CC   partial clone which were then used to isolate clones containing
CC   insert sequences located 5' or 3' from the initial clone. The
CC   full-length coding sequence was obtained. It encodes a protein,
CC   designated GRB-1, which contains two SH2 domains and one SH3 domain.
CC   The protein is capable of binding to tyrosine-phosphorylated domains
CC   of receptor tyrosine kinases.
CC   See also Q27255.

PT   DNA encoding tyrosine kinase-binding proteins - used to screen
PT   agents capable of modulating cell growth or cellular metabolism
PS   Example 3;  Page 125-127;  215pp;  English.
CC   Using a new cloning technique, CORT (cloning of receptor targets)
CC   several new tyrosine kinase (TK) binding proteins were isolated. Growth
CC   factor receptor bound proteins GRB-1,GRB-2, GRB-3, GRB-4, GRB-7 and
CC   GRB-10 were isolated using this method. This sequence encodes GRB-1.
CC   The proteins bind to a tyrosine-phosphorylated domain of a eukaryotic
CC   TK. GRB proteins can be used for screening agents which are capable
CC   of modulating cell growth that occurs via signal transduction through
CC   TKs. Such agents can be used to prevent or inhibit cell growth or to
CC   counteract tumour development. GRB proteins are also useful for
CC   identifying susceptibility to diseases associated with alterations in
CC   cellular metabolism mediated by TK pathways e.g. cancer and diabetes.

PT   New gene ATM implicated in ataxia-telangiectasia and related protein
PT   - useful in screening methods, partic. for identifying disease
PT   carriers.
PS   Example 2; Page 68-71; 127pp; English.
CC   This is a 5.9 kb cDNA clone, designated 7-9, obtained from a fibroblast
CC   cDNA library. This sequence represents only part of the ATM gene
CC   transcript. Mutations in the ATM gene cause ataxia-telangiectasia (A-T),
CC   a progressive genetic disorder affecting the central nervous and immune
CC   systems. The ATM gene, located at chromosome 11q22-23, is probably
CC   involved in a novel signal transduction system that links DNA damage
CC   surveillance to cell cycle control. The ATM gene product (W07655) has a
CC   highly conserved C-terminal region showing high sequence homology to the
CC   catalytic domain of phosphatidylinositol-3 kinases. A-T mutations affect
CC   a variety of tissues and lead to cancer predisposition. Identification of
CC   A-T carriers, by analysis at nucleic acid or protein levels, allows
CC   better supervision and treatment of such subjects who are at increased
CC   risk of developing cancer and are particularly sensitive to radiation.
CC   The transgenic animals and transformed cells are useful as models of the
CC   human disease. Also viral vectors expressing the ATM protein can be used
CC   in gene therapy of A-T.

PT   New isolated ataxia-telangiectasia gene - used to develop prods. for
PT   the study, diagnosis and treatment of ataxia-telangiectasia.
PS   Example 2; Page 83-86; 153pp; English.
CC   This sequence represents clone 7-9 of the ATM gene, isolated from a
CC   fibroblast cDNA library. The full length wild type ATM open reading frame
CC   sequence is shown in T43497. T43444-T43496 represent exons of the ATM
CC   gene of the invention, which is located in the genome at chromosome
CC   segment 11q22-23. Ataxia-telangiectasia (A-T) is caused by mutations,
CC   insertions, or deletions in the coding region of the ATM gene. A-T is a
CC   progressive genetic disorder affecting the central nervous and immune
CC   systems. A-T involves chromosomal instability, cancer predisposition,
CC   radiation sensitivity, and cell cycle abnormalities. A-T is a
CC   multi-system disease inherited in an autosomal recessive manner.
CC   Cerebellar ataxia that gradually develops into general motor dysfunction
CC   is the first clinical hallmark of A-T, and results from progressive loss
CC   of Purkinje cells in the cerebellum. Oculocutaneous telangiectasia
CC   (dilation of blood vessels) develops in the bulbar conjunctiva and facial
CC   skin, and is later accompanied by graying of the hair and atrophic
CC   changes in the skin. The co-occurrence of cerebellar ataxia and
CC   telangiectases in the conjunctivae and occasionally on the facial skin
CC   (the second early hallmark of A-T) usually establishes the differential
```

```
CC   diagnosis of A-T from other cerebellar ataxias. The gene, can be used in
CC   methods for detecting carriers of a defective gene that causes A-T. The
CC   gene can also be used to generate antibodies. The methods and antibodies
CC   can be used in the study, diagnosis and therapy of A-T.

PT   Factor VIII:C analog modified adjacent to a non-activating Arg
PT   residue - used in the treatment of haemophiliacs, by improvement of
PT   haemostasis
PS   Disclosure; Fig 1; 90pp; English.
CC   This sequence represents the coding sequence for native Factor VIII:C.
CC   Factor VIII:C is a large glycoprotein that participates in the blood
CC   coagulation cascade that ultimately converts soluble fibrinogen to
CC   insoluble fibrin clot, effecting haemostasis. A deficiency in Factor
CC   VIII:C is responsible for haemophilia A, which is an X-chromosome-linked
CC   inherited bleeding diathesis. Factor VIII:C is activated by plasma
CC   proteases, such as thrombin. During activation the mature polypeptide is
CC   cleaved to generate heavy and light chain fragments that are further
CC   cleaved. This sequence is mutated, using mutagenic primers, to produce
CC   the active Factor VIII:C analogues of the invention (such as W11330). The
CC   analogues comprise a native Factor VIII:C polypeptide modified at a site
CC   adjacent to a non-activating Arg residue so that a Arg-Pro or Pro-Arg
CC   dipeptide is created. Complexes of two or more of the analogues, nucleic
CC   acids and vectors encoding them may be used alone or in conjunction with
CC   each other, for the prevention or treatment of active Factor VIII:C
CC   deficiency in a mammal. The analogues may be used as immunogens to raise
CC   antibodies, and in the treatment of haemophiliacs, by improvement of
```

```
CC   haemostasis. The analogues are resistant to proteolytic cleavage and
CC   display increased plasma half-life. They may be administered at lower
CC   dosages and by different modes of administration.

PT   Nucleic acid encoding porcine factor VIII - used to obtain
PT   porcine and human-porcine chimeric factor VIII for treating
PT   haemophilia
PS   Disclosure; Page 27-36; 61pp; English.
CC   Prepn. of human factor VIII cDNA has been set forth in detail, e.g.,
CC   US Patent No. 4,757,006 issued July 12, 1988 and in Toole et al.,
CC   Nature 312:312(1984). A recombinant clone contg. the nucleotide
CC   sequence in Q66615, designated as pSP64-VIII, is on deposit at the
CC   ATTC under Accession No. ATCC 39812. Chimeric forms of factor VIII
CC   include those where various domains of the human factor VIII have
CC   been replaced, in whole or in part, by analogous porcine factor VIII
CC   domains, and include, chimeric forms where the A1 and/or A2 domains,
CC   in whole or in part, of the human factor VIII sequence have been
CC   replaced, in whole or in part, by the A1 and/or the A2 domains of
CC   porcine factor VIII. Specifically provided are chimeric factor VIII
CC   sequences comprising the A1, A2, A3, B, C1 and C2 human domains  as
CC   set forth in Q66615, where the A1 and/or A2 domains, as well as
```

```
CC   other segments, such as the regions corresp. to the AA numbers
CC   336-372, 336-740, 372-740, 700-740 and combinations of these
CC   regions have been replaced in whole or in part with porcine factor
CC   VIII sequences as set forth in Q66616 and R55353.

PT   Protein having pro-coagulant activity - obtd. from truncated
PT   version of DNA sequence which expresses complete human factor
PT   VIII-C
PS   Claim 5; Table 1,Pages 3-9; 30pp; English.
CC   The procoagulant polypeptides of the invention are truncated
CC   versions of human factor VIII C, having a portion of AAs 760-1708
CC   (see P60741) removed. Specifically claimed polypeptides have the
CC   following deletions: AAs 1001-1581; AAs 779-1658; and AAs 779-1693;
CC   and the DNA encoding them. The procoagulant proteins lessen the
CC   likelihood of developing antibodies to the procoagulants and
CC   facilitate the treatment of patients in need of procoagulant therapy
CC   e.g. Haemophilia A treatment.

PT   Proteins having Factor VIII activity -
PT   comprising deletion mutant proteins of Factor VIII in which
PT   central region has been deleted
PS   Example; Fig 1; 37pp; English.
```

```
CC   The isolation of Factor VIII mRNA from human liver, and the preparation,
CC   purification and identification of cDNA and its assembly in the plasmid
CC   pEP121 resulting in plasmid pCLB89 have been described in patent
CC   application EP 0253455. The Factor VIII polypeptides of the invention
CC   include deletion mutant proteins of Factor VIII in which the central
CC   region or "B domain" as well as a portion of the 92 kD region has been
CC   deleted. The polypeptides have enhanced Factor VIII activity and/or
CC   decreased immunogenicity and can be used for the treatment of
CC   Haemophilia A. They can also be used to prepare antibodies. The Abs.
CC   can be used to determine the concn. of Factor VIII in a body fluid.

            * This sequence is unfinished. It consists of 1 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *         1   196475: contig of 196475 bp in length.

  TITLE     Direct Submission
  JOURNAL   Submitted (10-FEB-1998) sanger.ac.uk/HGP/ChrX/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Feb 14, 1998 this sequence version replaced gi:2598473.
            IMPORTANT: This sequence is the entire insert of clone 93C23.
            During sequence assembly data are compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap. This sequence was generated from part of
            bacterial clone contigs of human chromosome X, constructed by the
            Sanger Centre chromosome X mapping group. Further information can
            be found at http://www.sanger.ac.uk/HGP/ChrX/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 93C23 is at 1 in this sequence. The true
            right end of clone 93C23 is at 72245.
            93C23 is from the library RPCI1 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.

  COMMENT   Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=Y102A5C
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT: This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone Y102A5C.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F49H6 is at 91184 in this sequence. The
            true right end of clone F09C6 is at 102 in this sequence. The start
            of this sequence (1. .102) overlaps with the end of sequence Z81496.
            The end of this sequence (91183. .91286) overlaps with the start of
            sequence Z81545.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            Clone RG293F17 is from a release of the human BAC library
            CITB-HS-A.  The library contains cloned DNA from human sperm.  See:
             Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J.
            Kim et al., Genomics 34:213-8 (1996).  The clone is available from
            Research Genetics, Inc. (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the right is RG326G04, 200 bp overlap.
            Actual start of this clone is at base position 1 of RG293F17;
            actual end is at 116215 of RG293F17.

            This clone contains STS sWSS2601 (NID:g1222836).

            This clone RG293F17 contains a bacterial transposon from base
            position 4508-5845, which has been cut from the submitted sequence.

COMMENT     On Aug 1, 1998 this sequence version replaced gi:1888382.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments.
            ***                                                          ***
            *** WARNING: Phase 1 High Throughput Genome Sequence         ***
            ***                                                          ***
            * This sequence is unfinished. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.

            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=Y17D7A
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone Y17D7A.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone Y17D7 is at 1 in this sequence. The true
            left end of clone C54E10 is at 21382 in this sequence. The end of
            this sequence (21382. .21494) overlaps with the start of sequence
            Z81487.

TITLE     Direct Submission
JOURNAL   Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
          jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT   Coding sequences below are predicted from computer analysis, using
          predictions from Genefinder (P. Green, U. Washington), and other
          available information.
          For a graphical representation of this sequence and its analysis
          see:-
          http://webace.sanger.ac.uk/cgi-
          bin/display?db=wormace&class=Sequence &object=F08G5
          Current sequence finishing criteria for the C. elegans genome
          sequencing consortium are that all bases are either sequenced
          unambiguously on both strands, or on a single strand with both a
          dye primer and dye terminator reaction, from distinct subclones.
          Exceptions are indicated by an explicit note.
          IMPORTANT:  This sequence is NOT necessarily the entire insert of
          the specified clone.  It may be shorter because we only sequence
          overlapping sections once, or longer because we arrange for a small
          overlap between neighbouring submissions.
          IMPORTANT: This sequence is not the entire insert of clone F08G5.
          It may be shorter because we only sequence overlapping sections
          once, or longer because we arrange for a small overlap between
          neighbouring submissions.
          The true left end of clone F08G5 is at 1 in this sequence. The true
          right end of clone F08G5 is at 7448 in
          sequence Z70680.
          The true left end of clone C25G4 is at 32680 in this sequence. The
          true right end of clone F28D1 is at 725 in this sequence. The start
          of this sequence (1. .103) overlaps with the end of sequence Z70684.
          The end of this sequence (32680. .32784) overlaps with the start of
          sequence Z70680.

  TITLE     Direct Submission
  JOURNAL   Submitted (26-SEP-1998) Drosophila Genome Center, Lawrence Berkeley
            Laboratory, MS 64-121, Berkeley, CA 94720, USA
COMMENT     For further information about this sequence, including its location
            and relationship to other sequences, please visit our sequence
            archive Web site (http://fruitfly.berkeley.edu/sequence/) or send
            email to drosophila@mhgc.lbl.gov. All contigs in this submission
            meet the following cutoffs: length >= 400 bases, phrap computed
            error rate <= 1/10.                                          ***
            ***                                                          ***
            *** WARNING: Phase 1 High Throughput Genome Sequence         ***
            ***                                                          ***
            * This sequence is unfinished. It consists of 27 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *       1     1133: contig of 1133 bp in length

            Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=C34D1
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
```

```
            This sequence is the entire insert of clone C34D1. The true right
            end of clone F57B1 is at 5273 in this sequence. The start of this
            sequence (1. .744) overlaps with the end of sequence Z78064.
            The end of this sequence (44923. .45022) overlaps with the start of
            sequence AL022271.

            USA
  REMARK    Complete nucleotide sequence of the human T-cell receptor alpha
            delta locus
COMMENT     Sequencing method: high redundancy shotgun.  Interspersed Repeats
            were identified with RepeatMasker (available from
            http://ftp.genome.washington.edu/RM/RepeatMasker.html) Simple
            sequence repeats were identified with sputnik (available from
            http://serac.mbt.washington.edu/~chrisa/software/sputnik.html).

            * This sequence is unfinished. It consists of 13 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone is from a release of the human BAC library. The library
            contains cloned DNA from human sperm.  See:  Shizuya et al., Proc.
            Natl. Acad. Sci. USA 89:8794-7 (1992); Kim et al., Genomics
            34:213-8 (1996).  The clone is available from Research Genetics,
            Inc. (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
```

```
            The clone sequenced to the right is RG208003, 200 bp overlap.
            Actual start of this clone is at base position 1 of RG204I16;
            actual end is at 197273 of RG204I16.  This clone is part of an
            unanchored island, orientation is unknown.

            This clone contains STS's sWSS2434 (NID:g1113491), sWSS3360
            (NID:g1185343).

  JOURNAL   Submitted (24-SEP-1998) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     On Oct 1, 1998 this sequence version replaced gi:3668098.
            All repeats were identified using RepeatMasker: Smit, A.F.A. &
            Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html.
            ***                                                          ***
            *** WARNING: Phase 1 High Throughput Genome Sequence ***
            ***                                                          ***
            * This sequence is unfinished. It consists of 4 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *       1    25656: contig of 25656 bp in length
            *                   gap of unknown length
            *   25657   101180: contig of 75524 bp in length
```

```
            *                   gap of unknown length
            *  101181   199751: contig of 98571 bp in length
            *                   gap of unknown length
            *  199752   236157: contig of 36406 bp in length.

  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=F29D10
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone F29D10.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F29D10 is at 1 in this sequence. The
            true left end of clone F55H12 is at 23844 in this sequence. The
            true right end of clone F36A2 is at 5793 in this sequence. The
            start of this sequence (1. .114) overlaps with the end of sequence
            Z81077.
            The end of this sequence (23844. .23952) overlaps with the start of
            sequence Z81091.

  TITLE         Direct Submission
  JOURNAL       Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
                jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT         On Dec 25, 1996 this sequence version replaced gi:1695005.
                Coding sequences below are predicted from computer analysis, using
                predictions from Genefinder (P. Green, U. Washington), and other
                available information.
                For a graphical representation of this sequence and its analysis
                see:-
                http://webace.sanger.ac.uk/cgi-
                bin/display?db=wormace&class=Sequence &object=C54C8
                Current sequence finishing criteria for the C. elegans genome
                sequencing consortium are that all bases are either sequenced
                unambiguously on both strands, or on a single strand with both a
                dye primer and dye terminator reaction, from distinct subclones.
                Exceptions are indicated by an explicit note.
                IMPORTANT:  This sequence is NOT necessarily the entire insert of
                the specified clone.  It may be shorter because we only sequence
                overlapping sections once, or longer because we arrange for a small
                overlap between neighbouring submissions.
                IMPORTANT: This sequence is not the entire insert of clone C54C8.
                It may be shorter because we only sequence overlapping sections
                once, or longer because we arrange for a small overlap between
                neighbouring submissions.
                The true left end of clone C54C8 is at 21084 in
                sequence Z81492.
                The true right end of clone C54C8 is at 23957 in this sequence. The
```

true right end of clone E03H4 is at 106 in this sequence. The start of this sequence (1. .106) overlaps with the end of sequence Z81492.

```

  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=F14F11
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
```

```
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone F14F11.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F14F11 is at 1 in this sequence. The
            true right end of clone F14F11 is at 12071 in
            sequence Z54327.
            The true left end of clone C26D10 is at 25243 in this sequence. The
            start of this sequence (1. .100) overlaps with the end of sequence
            AL023831.
            The end of this sequence (25243. .25350) overlaps with the start of
            sequence Z54327.

            bin/display?db=wormace&class=Sequence &object=F22B8
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone F22B8.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F22B8 is at 1 in this sequence. The true
            right end of clone F22B8 is at 9256 in
            sequence Z83109.
            The true left end of clone F44G3 is at 27005 in this sequence. The
            true right end of clone F14H3 is at 12320 in this sequence. The
            start of this sequence (1. .104) overlaps with the end of sequence
            Z83105.
            The end of this sequence (27005. .27102) overlaps with the start of
            sequence Z83109.

    TITLE   Direct Submission
    JOURNAL Submitted (02-FEB-1998) Department of Genetics, Washington
            University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
  COMMENT   Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University,
                  St. Louis, MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone

                        NEIGHBORING COSMID INFORMATION:
```

```
            The 5' cosmid is Y55F3C;3' cosmid is Y55F3B.  Actual start of this
            cosmid is at base position 1 of CELF56B3; actual end is at 38574 of
            CELF56B3

            NOTES:

            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

COMMENT             Submitted by:
                    Genome Sequencing Center
                    Department of Genetics, Washington University,
                    St. Louis, MO  63110, USA, and
                    Sanger Centre, Hinxton Hall
                    Cambridge CB10 IRQ, England
                    e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk
                    NEIGHBORING COSMID INFORMATION:
          The 5' cosmid is C13E3, 200 bp overlap;3' end lies in a gap
          followed by the cosmid C48C5.  Actual start of this cosmid is at
          base position 197 of CELD1009; actual end is at 40475 of CELD1009

          NOTES:
          Coding sequences below are predicted from computer analysis, using
          the program Genefinder(P. Green and L. Hillier, ms in preparation).

  COMMENT     Submitted by:
                      Genome Sequencing Center
                      Department of Genetics, Washington University,
                      St. Louis, MO  63110, USA, and
                      Sanger Centre, Hinxton Hall
                      Cambridge CB10 IRQ, England
                      e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

              NOTICE:  This sequence may not be the entire insert of this clone.
              It may be shorter because we only sequence overlapping sections
              once, or longer because we provide a small overlap between
              neighboring submissions.

              This sequence was finished as follows unless otherwise noted:
              all regions were double stranded or sequenced with an alternate
              chemistry; an attempt was made to resolve all sequencing problems,
              such as compressions and repeats; all regions were covered by
              sequence from more than one subclone

                           NEIGHBORING COSMID INFORMATION:

              The 5' cosmid is C44E4, 1602 bp overlap;3' end lies in a gap.
              Actual start of this cosmid is at base position 1497 of CELD1007;
              actual end is at 47554 of CELD1007.  This cosmid lies in an
              unanchored cluster, the orientation of which is unknown.

              NOTES:

              Coding sequences below are predicted from computer analysis, using
              the program Genefinder(P. Green and L. Hillier, ms in preparation).

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone is from the first BAC library from Genome Systems, Inc.
            (http://www.genomesystems.com).
            Cell line:  lymphoblastoid
            Haplotypes:  two
            VECTOR:  pBeloBAC
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RG104I04, 200 bp overlap;  the
            clone sequenced to the right is GS165I04, 200 bp overlap.  Actual
            start of this clone is at base position 123004 of RG104I04; actual
            end is at 70125 of GS440B14.

            This clone contains STS's sWSS2937 (NID:g1113649), sWSS2945
            (NID:g1113653), and sWSS1091 (NID:g394026).

RESULT   50
LOCUS       AB005237    87835 bp    DNA             PLN       11-DEC-1997
DEFINITION  Arabidopsis thaliana genomic DNA, chromosome 5, P1 clone: MJJ3,
            complete sequence.
ACCESSION   AB005237
NID         g2264309
KEYWORDS    HTG.
SOURCE      Arabidopsis thaliana (strain:Columbia) DNA, clone_lib:Mitsui P1
            clone:MJJ3.
  ORGANISM  Arabidopsis thaliana
            Eukaryotae; Viridiplantae; Charophyta/Embryophyta group;
            Embryophyta; Tracheophyta; seed plants; Magnoliophyta;
            Magnoliopsida; Capparales; Brassicaceae; Arabidopsis.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 791; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Thrombopoietin polypeptide, ligand for mpl cytokine receptor  -
PT   useful for treating thrombocytopenia and related diseases
PS   Example 8; Fig 14; 192pp; English.
CC   This sequence represents a genomic clone encoding human thrombopoietin
CC   (TPO), also known as mpl ligand (hML).  The human gene comprises 6 exons
CC   within 7 kb of genomic DNA.  Exons 1 and 2 contain 5' untranslated
CC   sequence and the initial four amino acids of the signal peptide.  The
CC   remainder of the secretory signal and the first 26 amino acids of the
CC   mature protein are encoded within exon 3.  The entire carboxyl domain
CC   and 3' untranslated sequence, as well as approx. 50 amino acids of the
CC   erythropoietin-like domain are encoded within exon 6.  The four amino
CC   acids involved in the deletion observed in hML-2 (hTPO-2) are encoded at
CC   the 5' end of exon 6.  Analysis of human genomic DNA by Southern blot
CC   indicated the gene for TPO is present in a single copy. The chromosomal
CC   location of the gene was determined by fluorescent in situ hybridisation
CC   which mapped to chromosome 3q27-28.  The protein encoded by this sequence
CC   binds to mpl which is a megakaryocytopoietic cytokine receptor which may
CC   transduce a thrombopoietic signal.  The N-terminal fragment of hML shows
CC   high levels of homology with human erythropoietin (hEPO).  This
CC   constitutes the EPO-domain.  The EPO-domain spans from Cys7 to Cys151
CC   of mature hML.

PT   Thrombopoietin polypeptide which specifically stimulates or
PT   increases platelet production - useful in treatment of
PT   thrombocytopenia, also related DNA and vectors
PS   Example 22; Page 282-284; 383pp; English.
CC   This sequence represents the coding sequence for a thrombopoietin (TPO)
```

```
CC   protein.  This sequence contains the sequence represented by Q99553.  TPO
CC   is a humoral factor capable of promoting platelet production.  The
CC   encoded protein can be purified by using a gel affinity column where Mpl
CC   has been coupled to a resin.  Q99551-Q99553 also encode TPO proteins.
CC   The DNA sequences are inserted into vectors which are used to transform
CC   prokaryotic and eukaryotic host cells.  Using the proteins encoded by
CC   these sequences, and derivatives of them, antibodies specifically
CC   immunoreactive with a TPO protein can be created.  The antibodies, DNA
CC   sequences and vectors are used to isolate the protein sequences.  The TPO
CC   proteins can then be used in the treatment of platelet disorders.  These
CC   include thrombocytopenia, hypoplastic anaemia, AIDS, disseminated
CC   intravascular coagulation syndrome and thrombotic thrombocytopenia.

PT   Thrombopoietin polypeptide, ligand for mpl cytokine receptor  -
PT   useful for treating thrombocytopenia and related diseases
PS   Claim 10; Fig 1; 192pp; English.
CC   This sequence encodes human thrombopoietin (TPO), also known as mpl
CC   ligand (hML).  The protein encoded by this sequence binds to mpl which
CC   is a megakaryocytopoietic cytokine receptor which may transduce a
CC   thrombopoietic signal.  The N-terminal fragment of hML shows high levels
CC   of homology with human erythropoietin (hEPO).  This constitutes the EPO-
CC   domain.  The EPO-domain spans from Cys7 to Cys151 of mature hML.  The
CC   full length hML protein and fragment polypeptides derived from the
CC   EPO-domain, may be used to stimulate survival, proliferation,
CC   differentiation, and maturation of haematopoietic cells, esp.
CC   megakaryocytes.  They are useful in the treatment and prevention
CC   of thrombocytopenia, myeloproliferative diseases, inflammatory
CC   thrombocytosis, iron deficiency etc.  Chimera's of the fragment
CC   polypeptides and EPO can regulate growth and proliferation of both
CC   platelet and red blood cell progenitors.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Example 10; Page 2186; 2245pp; Japanese.
CC   This is the sequence of a primer based on the sequence of the human gene
CC   signature (GS) sequence HUMGS02342 (T21342) which was used to reverse
CC   transcribe mRNA isolated from human foetal liver polyA+ RNA for cloning
CC   the cDNA encoding the human mpl-ligand, using the 5'-amplifinder (RTM)
CC   kit.  The resultant cDNA strand was ligated to the ampliFINDER Anchor
CC   primer (T26843) and the clone was amplified using PCR primers T26844 and
CC   T26846.
CC   The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA
CC   libraries prepared from various human tissues; synthesis of cDNA was
CC   initiated from the 3'-end of mRNA by using poly(T) as the sole primer.
CC   Each library is constructed so as to reflect accurately the relative
CC   abundance of different mRNAs in the particular tissue from which it was
CC   derived.  The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS sequences)
CC   as a means of diagnosing abnormal cell function or for recognising
CC   different cell types.

PT   Isolated nucleic acid fragment, for plant lipid compsn.
PT   modification - comprises nucleic acid sequence encoding fatty
PT   acid desaturase or related enzyme with high aminoacid identity to
PT   specific polypeptide
PS   Claim 1; Page 127-129; 167pp; English.
CC   pCF3 was isolated from a cDNA library using a 5.2 kb Hind III
CC   fragment containing wild-type genomic DNA as a radiolabeled
CC   hybridization probe. One of the sequenceing primers made to the pCF3
CC   insert was also used. The identity of the expression product of pCF3
CC   as the Arabidopsis microsomal delta-15 desaturase was confirmed by
CC   its biological overexpression in plant tissues. Conserved regions of
CC   R37592 are useful in designing long oligomers for hybridization as
CC   well as shorter ones for use as primers in the PCR. The sequences
CC   of useful regions are given in Q43213-Q43224.

PT   Prodn. of human urokinase glycoproteins - using a recombinant
```

```
PT   expression system used for the treatment of vascular diseases or
PT   conditions.
PS   Example; Fig 2; 41pp; English.
CC   Q73481 is the cDNA sequence which encodes R63140 a low molecular
CC   weight 33000 dalton urokinase (UK) bioactive protein. This cDNA
CC   was used in the construction of a plasmid capable of transforming
CC   either yeast or vertebrate cells, enabling them to produce the
CC   33000 dalton UK bioactive protein. The UK glycoprotein produced
CC   could then be used in the treatment of cardiovascular diseases,
CC   including pulmonary embolism. The UK produced using this method
CC   had the advantage of a specific activity towards fibrin and extant
CC   thrombi, not demonstrated previously with UK isolated from natural
CC   sources.

PT   Protease compsn. for wound treatment - contains protease from
PT   Vibrio, esp. V proteolyticus, which hydrolyses components of
PT   necrotic tissue but not native tissue
PS   Claim 3; Fig 1; 23pp; English.
CC   The vibrolysin protease can be produced by aerobic fermentation of
CC   Vibrio species in nutrient medium.  The DNA sequence was obtd. by
```

```
CC   cloning the Vibrio protease.  A gene library was prepd. using Vibrio
CC   chromosomal DNA.  The DNA underwent partial digestion with Sau3A
CC   and ligation into E. coli cosmid vector pHC79.  The recombinant
CC   vectors were packaged into bacteriophage lambda and used to
CC   transform E. coli strain HB101.  Clones contg. vibriolysin were
CC   found to produce a zone of clearing on milk agar plates due to
CC   proteolytic hydrolysis of the caesin component of milk. The
CC   protease is capable of digesting necrotic tissue while viable
CC   living tissue is not injured.  It causes wound debridement and
CC   stimulates vascularisation and healing of traumatised tissue. The
CC   protease can be used in management of full and partial thickness
CC   wounds, burn wounds, debridement of ulcerative lesions, principally
CC   pressure (decubitus) ulcers and varicose stasis and trophic ulcers,
CC   prepn. of skin graft sites and general surgical wounds such as
CC   amputation, incisional, traumatic and pyogenic wounds and for the
CC   treatment of vaginitis, cervicitis, circumcisions, episitomy, cyst
CC   wounds, carbuncles, sunburn, frostbite and cataract scar tissue.

PT   Modified low mol. wt. plasmingen activator- formed of
PT   amino acids comprising the amino acid portion of
PT   prourokinase from 150 to 411
PS   Disclosure; Figure 1; 27pp; English.
CC   A low mol. wt. polypeptide plasminogen activator (PA) is claimed which is
CC   formed from amino acids 150-411 of prourokinase. The preferred intiation
CC   region for the low mol. wt. PA is indicated (tag d). A low mol wt. PA
CC   can be injected into blood in the body in vivo to dissolve clots
CC   without harm.

PT   Prodn. of human urokinase glycoproteins - using a recombinant
PT   expression system used for the treatment of vascular diseases or
PT   conditions.
PS   Example; Fig 4; 41pp; English.
CC   Q73483 is the cDNA sequence which encodes R63141 the full length
CC   54000 dalton human urokinase (UK) protein. This cDNA was used in
CC   the construction of a plasmid capable of transforming either yeast
CC   or vertebrate cells, enabling them to produce the 54000 dalton
CC   human UK protein. The UK glycoprotein produced could then be used
CC   in the treatment of cardiovascular diseases, including pulmonary
CC   embolism. The UK produced using this method had the advantage of a
CC   specific activity towards fibrin and extant thrombi, not
CC   demonstrated previously with UK isolated from natural sources.

PT   Amino acid modified form of prourokinase - having high fibrin
PT   selectively and resistant to cleavage to the two-chain form
PS   Disclosure; Fig.1; 18pp; English.
CC   The amino acid LYS at position 158 of the mature protein (see tag b)
CC   is replaced by MET and the amino acid ILE at position 160 (bases
CC   614-616) is replaced by SER, achieved by site-directed mutagenesis
CC   or by chemial modification.
CC   The modified PUK has a single polypeptide chain, high fibrin
CC   activity and is resistant to cleavage to the two-chain form to
CC   an extent greater than its original unmodified form.
CC   The therapeutic specificity of single-chain PUK can be increased
CC   without decreasing fibrinolytic activity.  The single chain form
CC   can have high fibrin activity and thus does not cause general
CC   bleeding in the body but rather can be localised to the site of
CC   the blood clot directly.
CC   See also N71368-69 and N71338.

PT   Cloning and expression of neutral protease genes -
PT   using DNA encoding enzymes of Vibrio proteolyticus or Bacillus
PT   species in gram-negative microorganisms
PS   Figure 1; 16pp; English.
CC   Figure 1 gives the translation of the entire sequence, hence the large
CC   number of CDS, which are separated by stop codons. Recombinant DNA
CC   contg. a Vibrio nuclear protease enzyme (NPE) gene is claimed as are
CC   gram-negative microorganisms contg. DNA coding from more than one NPE of
CC   Vibrio proteolyticus. The microorganisms are pref. E.coli or Serratia
CC   species, esp. E.coli ATCC 67499 or 67501. The gram-negative
CC   microorganisms synthesise active protease enzyme. The genes can be
CC   manipulated for the overprodn. of NPE.

PT   New homeo:protein regulator of insulin gene expression - and related
PT   DNA and antibodies, useful for detecting e.g diabetes or breast
PT   cancer
PS   Claim 14; Fig 2A; 96pp; English.
CC   The present sequence encodes the human HoxB13, homeoprotein
CC   regulator of insulin gene expression. The novel homeoprotein regulator
CC   of insulin gene expression is a protein (or its active fragments,
CC   agonists and/or mimics) which binds the FLAT element of an insulin gene
CC   promoter; which is modulated by a Ca2+-dependent CaM kinase IV; and
CC   which is homologous to a sequence encoded by a Hox gene complex.
CC   Detection of altered levels of this protein indicates a disease related
CC   to glucose homeostasis, particularly (non-)insulin dependent diabetes,
CC   hypo- or hyper- glycaemia, or also breast cancer. Antibodies are useful
CC   as reagents for immunoassays. The protein and compounds that promote and
CC   inhibit its production or activity or its specific binding partners, are
CC   useful for preventing or treating the specified diseases, especially
CC   where insulin is also being administered.

PT   Detecting markers for avirulence in Mycobacterium - used in
PT   production of vaccines against bacterial infection, and to detect
PT   bacterial infection
PS   Example 1; Fig 3; 66pp; English.
CC   This DNA sequence comprises Mycobacterium bovis BCG deletion
CC   sequence BCGdelta3.  A specific genetic deletion of this region
CC   results in an avirulence phenotype of the mycobacterium.  2 Other
CC   deletion regions (see T33535 and T33536) have also been detected.
CC   Identification involved screening a BCG cosmid library with a
CC   radiolabeled probe obtained following DNA subtraction between
CC   virulent Mycobacterium tuberculosis H37Rv and avirulent BCG.
CC   The deletions provide useful markers for the identification of an
CC   avirulent, or a virulent, mycobacterial phenotype.  Determination
CC   of avirulence requires the detection of the presence or absence of
CC   the deletion; the deletions are detected either by detecting the
CC   presence or absense of deletion junctions (see T33538-46), or by
CC   detecting the presence or absence of the sequences contained within
CC   the deletion.  Deletion polypeptides are used as components of
CC   immunological assays and in vaccines.

PT   Anti:sense oligo:nucleotide(s) to murine urokinase mRNA - for
PT   inhibiting tumour cell invasion and metastasis
PS   Claim 1; Column 9-10; 14pp; English.
CC   T44560-77 are antisense phosphorothioate oligonucleotides (PONs)
CC   complementary to the mRNA of protease enzymes involved in tumour
CC   invasion. Urokinase (UK) is important in metastasis of tumours and PONs
CC   to urokinase plasminogen activator (UPA) have demonstrated in vivo and in
CC   vitro reduction of metastasis of breast cell cancer. The effect of
CC   several PONs on 410.4 cell invasion through matrigel coated membranes was
CC   tested. The present sequence, which is complementary to the mRNA of
CC   human UPA (position 1728) was tested for effects on the invasion of
CC   the cell line. The inhibitory effect on invasion was specific to the
CC   sequence of the urokinase type plasminogen activator mRNA.

PT   Target peptide-penI protein fusion polypeptide - purified by
PT   reducing ionic strength of soln. to precipitate the fusion
PT   polypeptide
PS   Example 5; Page 31; 67pp; English.
CC   T02529-T02532 represent amplification primers used in the construction of
CC   a GAP-N SH2 domain:penI fusion protein.  This sequence and T02530 amplify
CC   the penI sequence, while T02531 and T02532 amplify the GAP-N SH2 domain.
CC   The fusion protein is provided in solution and is contacted with an
CC   aqueous solution with sufficient ionic strength to precipitate the
CC   protein (preferably a buffer solution with a potassium chloride salt
CC   concentration of 200 mM or less).  The fusion protein is cleaved to
CC   provide the target polypeptide.  This method is useful for the synthesis
CC   and purification of any target peptide.  The fusion protein can be used
CC   to immunise a mammal against a specific antigen, by eliciting an immune
CC   response.  Also, for fine epitope mapping of a peptide by determining the
CC   binding activity of the fusion protein to the binding domain of a peptide
CC   (preferrably an antibody peptide).  The method can be used for selection
CC   of a target peptide, and for the identification of a peptide that
CC   modulates the activity of T cells.  The advantage of this method, is that
CC   it allows the purification of the fusion protein in a single step.  Also,
CC   for certain target peptides, the ability to induce or enhance T cell
CC   activity may be enhanced when the peptide is fused to penI.

PT   Selection marker gene free recombinant strains, esp. filamentous
PT   fungi, and methods for obtaining them  - for improved selection
PT   without use of antibiotics and with no undesired residual marker DNA
PT   following transformation
PS   Example 1; Page 14; 109pp; English.
CC   The sequences given in T34331-36 are primers which were used in the
CC   construction of the glaA gene replacement vector pGBDEL4L.  pGBDEL4L
CC   contains the 5' part of the A. niger amyloglucosidase (glaA) promoter
CC   region, a synthetic DNA sequence of 16 bp providing stop codons in all
CC   three reading frames, the A. nidulans acetamidase (amdS) gene under
CC   control of the A. nidulans glyceraldehyde-3-phosphate dehydrogenase
CC   (gpdA) promoter, flanked on both sides by 3' glaA non-coding sequences.
CC   The resultant vector was used in the method of the invention for the
CC   selection of transformed filamentous fungi from which the marker gene
CC   has been deleted.  This selection system reduces the need for antibiotic
CC   selection markers which give rise to an undesired spread of strains that
CC   have become resistant to antibiotics.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 2041; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Polymorphic bovine DNA markers - used in genetic identification,
PT   gene mapping, and selective breeding
PS   Table 7; Page 345; 517pp; English.
CC   The sequence is that downstream of a bovine microsatellite sequence
CC   obtd. by screening a library of bovine MboI DNA fragments of between
CC   250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC   One out of 50 clones cross-hybridised.  Assuming independent
CC   distribution of microsatellites and MboI sites, the frequency of
CC   (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC   000.  The sequence information for ca. 230 such bovine microsatellites
CC   is summarised in the specification and indexed herein (see below).
CC   The sequences upstream and downstream of the microsatellite sequence
CC   were used to generate the required PCR primers for in vitro
CC   amplification of the corr.esp. microsatellite (using the program
CC   OPTIPRIM).  The microsatellites may be used to identify individuals,
CC   for parentage testing, and in the genetic mapping of economic trait
CC   loci, or genes involved the determinism of economically important
CC   traits esp. in cattle, to allow selective breeding.

PT   cDNA fragment of human pancreatitis associated protein -
PT   produced by genetic engineering, and the corresponding antibody,
PT   for use in the diagnosis of pancreatitis
PS   Claim 3; Page 26; 49pp; French.
CC   This cDNA fragment was obtained by screening a human pancreatic cDNA
CC   library by hybridisation with a rat PAP cDNA probe, followed by a
CC   second screening of positive clones with a PSP cDNA probe (PSP is a
CC   protein with some structural similarities with rat PAP) and then
CC   recovering clones not reactive with the PSP probe and isolating cDNA
CC   fragments from them. Fragment S3 was cloned into pEX and the
CC   resultant recombinant transformed into E.coli. The expression
CC   product was used to generate antibodies for in vitro diagnosis of
CC   acute pancreatitis and for imaging the pancreas.

PT   New isolated ataxia-telangiectasia gene - used to develop prods. for
PT   the study, diagnosis and treatment of ataxia-telangiectasia.
PS   Claim 1; Page 61-62; 153pp; English.
CC   T43444-T43496 represent exons of the ATM gene of the invention.
CC   Ataxia-telangiectasia (A-T) is caused by mutations, insertions, or
CC   deletions in the coding region of the ATM gene. A-T is a progressive
CC   genetic disorder affecting the central nervous and immune systems. A-T
CC   involves chromosomal instability, cancer predisposition, radiation
CC   sensitivity, and cell cycle abnormalities. A-T is a multi-system disease
CC   inherited in an autosomal recessive manner. Cerebellar ataxia that
CC   gradually develops into general motor dysfunction is the first clinical
CC   hallmark of A-T, and results from progressive loss of Purkinje cells in
CC   the cerebellum. Oculocutaneous telangiectasia (dilation of blood vessels)
CC   develops in the bulbar conjunctiva and facial skin, and is later
CC   accompanied by graying of the hair and atrophic changes in the skin. The
CC   co-occurrence of cerebellar ataxia and telangiectases in the conjunctivae
CC   and occasionally on the facial skin (the second early hallmark of A-T)
CC   usually establishes the differential diagnosis of A-T from other
CC   cerebellar ataxias. The ATM gene, can be used in methods for detecting
CC   carriers of a defective gene that causes A-T. The gene can also be used
CC   to generate antibodies. The antibodies and methods can be used in the
CC   study, diagnosis and therapy of A-T.

CC   Antibodies which recognise the previously isolated and sequenced
CC   human Pancreatitis-Associated protein (PAP) are claimed. They are
CC   useful for measuring the amount of PAP in a sample to detect
CC   pancreatic disease associated with heterozygotic mutations in the
CC   CTFR gene. Such conditions result in expression of PAP at levels
CC   at least 2-3 times higher than normal.

PT   cDNA fragment of human pancreatitis associated protein -
PT   produced by genetic engineering, and the corresponding antibody,
PT   for use in the diagnosis of pancreatitis
PS   Claim 4; Fig 4; 49pp; French.
CC   This cDNA fragment was obtained by screening a human pancreatic cDNA
CC   library by hybridisation with a rat PAP cDNA probe, followed by a
CC   second screening of positive clones with a PSP cDNA probe (PSP is a
CC   protein with some structural similarities with rat PAP) and then
CC   recovering clones not reactive with the PSP probe and isolating cDNA
CC   fragments from them. This sequence includes fragment S3 (see
CC   Q14619) which corresponds to the CDS.

PT   Isolated galanin receptor proteins - used partic. to identify
PT   agonists or antagonists, which can be used to treat, e.g. ulcers,
PT   diabetes or dementia
PS   Claim 1; Page 48; 71pp; English.
CC   This sequence encoding a mouse galanin receptor protein was obtained
CC   from the mouse pancreatic beta-cell line, MIN6 (FERM BP-4954), and
CC   may be expressed recombinantly, using a vector, in e.g. CHO cells.
CC   The encoded protein is particularly used to identify agonists or
CC   antagonists which can be used to treat e.g. ulcers, diabetes or
CC   dementia, etc.  The protein can also be used for the detection of
CC   galanin, in the production of antibodies, and transgenic animals.

PT   Immunogenic type F botulinum toxin polypeptide(s) - allows
PT   recombinant vaccine prodn.
PS   Disclosure; Page 20-21; 37pp; English.
CC   A segment (T48100) of Clostridium botulinum type F strain Langeland
CC   genomic DNA codes for the heavy chain (amino acids 848-1278) of the
CC   type F neurotoxin (see also W09014).  A synthetic gene (T48101) for
CC   the heavy chain utilises preferred codons for high level expression
CC   in E. coli.  The heavy chain polypeptides (see also W09015-17) are
CC   free of botulinum toxin activity but can induce protective immunity
CC   to a type F botulinum toxin, making them useful for vaccine prodn.

PT   Human Transcription Factor III A gene - useful in regulation of
PT   transcription and for diagnosis and treatment of e.g. cancer related
PT   diseases
PS   Example 1; Page 11-13; 17pp; English.
CC   The sequence encodes human transcription factor-IIIA (hTFIIIA), a
CC   DNA binding protein with 9 zinc finger domains, which is necessary
CC   for the initiation of 5S RNA gene transcription, binding to an
CC   internal control region of the 5S gene.  The coding region
CC   (claimed) is given in T14037.  A fragment lacking a 5'-portion of
CC   the gene has been isolated from a human foetal brain cDNA library
CC   (OTK7-1), and the 5'-portion of the gene has been isolated by
CC   5'-rapid amplification of cDNA ends using primers H11-R (T14039),
CC   H11-E (T14040), H11-H (T14041) and AP-2 (T14042), complementary to
CC   anchor primer T14043.  Reverse transcription using H-11R is
```

```
CC   followed by anchor primer ligation and PCR using AP-2 and H11-E, to
CC   give a full-length cDNA, OTK7.  The gene and its encoded protein
CC   may be used in diagnosis, identification or therapy of hereditary
CC   diseases such as cancer, or other diseases resulting from abnormal
CC   transcriptional control, and to analyse the mechanisms involved in
CC   their activity.

PT   Prodn. of D-phenylalanine in E. coli - using recombinant E. coli
PT   contg. a new isolated gene encoding a Bacillus sphaericus
PT   D-amino:transferase
PS   Claim 15; Page 11-12; 24pp; English.
CC   This sequence represents the coding sequence for the D-aminotransferase
CC   of Bacillus sphaericus. D-aminotransferases reversibly catalyse the
CC   transamination of various D-amino acids and corresponding alpha-keto
CC   acids. This sequence was isolated by MboI digestion of B. sphaericus
CC   chromosomal DNA, transforming E. coli with the digested DNA, and
CC   analysing the DNA in transformants plated on appropriate medium
CC   (preferably a medium containing L-aspartic acid, L-alanine, and
CC   phenylpyruvate) that produced D-phenylalanine. The protein encoded by
```

```
CC   this sequence is used in the method of the invention for producing
CC   D-phenylalanine in E. coli.  The method comprises incorporating this gene
CC   into an E. coli, culturing the microorganism in a culture medium and
CC   isolating the D-phenylalanine from the culture.  The method provides for
CC   the high level production of D-phenylalanine, particularly
CC   enantiomerically-pure D-phenylalanine.

COMMENT     We are not submitting the same cDNA sequence redundantly to DDBJ
            since 1993. For the abundance information of clones with this
            sequence in this library and as well as in other 3'-directed
            libraries, see ' http://www.imcb.osaka-u.ac.jp/bodymap'.  The
            sequences of the clones represented by this GS sequences is also
            found there.

NID         g1023788
KEYWORDS    EST.
SOURCE      human clone=210544 primer=Promega -21ml3 library=Soares fetal liver
```

```
            spleen 1NFLS vector=pT7T3D (Pharmacia) with a modified polylinker
            host=DH10B (ampicillin resistant) Rsitel=Pac I Rsite2=Eco RI Liver
            and spleen from a 20 week-post conception male fetus. 1st strand
            cDNA was primed with a Pac I - oligo(dT) primer [5'
            AACTGGAAGAATTAATTAAAGATCTTTTTTTTTTTTTTTT 3'], double-stranded
            cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Pac
            I and cloned into the Pac I and Eco RI sites of the modified pT7T3
            vector.  Library went through one round of normalization. Library
            constructed by Bento Soares and M.Fatima Bonaldo.

                     was prepared from a pool of 6 anonymous Wilms' tumor RNAs.
                      RNA was prepared by acid-phenol, followed by one round of
                     oligo dT selection.  cDNA library preparation was with
                     the BRL/Life Tech. Superscript Plasmid system.  An
                     oligo-dT NotI primer for first strand synthesis generated
                     gcggccgccc(t)n at the 3' end of the clones.  A 5' SalI
                     adaptor was used  with sequence 5'-gtcgacccacgcgtccg-3'.
                     Resulting cDNAs were size selected (average size 2 kb),
                     NotI digested, and ligated into NotI/SalI-cut pSPORT1.
                     Library was constructed by Dr. Manfred Gessler."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  AUTHORS   Harris,B.
  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=F11A1
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            This sequence is the entire insert of clone F11A1. The true right
            end of clone M79 is at 5947 in this sequence. The start of this
            sequence (1. .104) overlaps with the end of sequence Z50806.
            The end of this sequence (39254. .39353) overlaps with the start of
            sequence AL009066.

COMMENT     Submitted by:
                Genome Sequencing Center
                Department of Genetics, Washington University,
                St. Louis, MO  63110, USA, and
                Sanger Centre, Hinxton Hall
                Cambridge CB10 IRQ, England
                e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
```

```
            sequence from more than one subclone

                        NEIGHBORING COSMID INFORMATION:

            The 5' cosmid is F18G5, 200 bp overlap:3' cosmid is T02A10.  Actual
            start of this cosmid is at base position 1 of CELB0416; actual end
            is at 44797 of CELB0416

            NOTES:

            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

COMMENT     Submitted by:
            Nematode Sequencing Project
            Department of Genetics, Washington University,
            St. Louis, MO  63110, USA, and
            MRC Laboratory of Molecular Biology,
            Cambridge CB2 2QH, England
            e-mail: rw@nematode.wustl.edu and jes@cele.mrc-lmba.cam.ac.uk NOTE:
            Coding sequences below are predicted from computer analysis, using
            the program Genefinder (P. Green and L. Hillier, in preparation)
            Neighboring cosmid information:
            Bases 1 to 200 of this entry correspond to bases 38383 to 38582 of
            CELK12H4 (GenBank:L14331).  Bases 21074 to 22073 of this entry
            correspond to bases 1 to 1000 of CELC14B9 (L15188). The actual
            cosmid sequence of K06H7 begins at nucleotide position 32992 of
            CELK12H4 and extends through this sequence and into CELC14B9 and
            ends at position 12266 of CELC14B9.

            Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     On Jun 13, 1998 this sequence version replaced gi:531558.
```

```
            Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=C06C3
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone C06C3.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone C06C3 is at 11451 in
            sequence Z47809.
            The true right end of clone C06C3 is at 104 in
            sequence AL023845.
            The true right end of clone F42A8 is at 16760 in this sequence. The
            start of this sequence (1. .56) overlaps with the end of sequence
            Z47809.
            The end of this sequence (31940. .32043) overlaps with the start of
            sequence AL023845.

    TITLE     Direct Submission
    JOURNAL   Submitted (06-NOV-1996) Nematode Sequencing Project, Sanger Centre,
              Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
              Washington University, St. Louis, MO 63110, USA. E-mail:
              jes@sanger.ac.uk or rw@nematode.wustl.edu
    COMMENT   On Nov 21, 1995 this sequence version replaced gi:443827.
              Coding sequences below are predicted from computer analysis, using
              predictions from Genefinder (P. Green, U. Washington), and other
              available information.
              For a graphical representation of this sequence and its analysis
              see:-
              http://webace.sanger.ac.uk/cgi-
              bin/display?db=wormace&class=Sequence &object=T07C4
              Current sequence finishing criteria for the C. elegans genome
              sequencing consortium are that all bases are either sequenced
              unambiguously on both strands, or on a single strand with both a
              dye primer and dye terminator reaction, from distinct subclones.
              Exceptions are indicated by an explicit note.
              IMPORTANT:  This sequence is NOT necessarily the entire insert of
              the specified clone.  It may be shorter because we only sequence
              overlapping sections once, or longer because we arrange for a small
              overlap between neighbouring submissions.
              IMPORTANT: This sequence is not the entire insert of clone T07C4.
              It may be shorter because we only sequence overlapping sections
              once, or longer because we arrange for a small overlap between
              neighbouring submissions.
              The true left end of clone T07C4 is at 1 in this sequence. The true
              left end of clone C38H2 is at 33374 in this sequence. The true
              right end of clone T07A5 is at 8844 in this sequence. The start of
              this sequence (1. .101) overlaps with the end of sequence Z48055.
              The end of this sequence (33374. .33477) overlaps with the start of
              sequence Z35641.

            * This sequence is unfinished. It consists of 9 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *        1     1560: contig of 1560 bp in length
            *     1561     1577: gap of unknown length

            BAC clone F13M22 is from Arabidopsis chromosome II and is near the
            molecular marker ve018.
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of three methods: Gene
            prediction programs including GRAIL (available by anonymous ftp
            from arthur.epm.ornl.gov), Genefinder (Phil Green, University of
            Washington), Genscan (Chris Burge,
            http://gnomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene
            (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the
            complete sequence against a peptide database and the Arabidopsis
            EST database at TIGR (http://www.tigr.org/tdb/at/at.html).
            Annotated genes are named to indicate the level of evidence for
            their annotation. Genes with similarity to other proteins are named
            after the database hits. Genes without significant peptide
            similarity but with EST similarity are named as 'unknown' proteins.
            Genes without protein or EST similarity, that are predicted by more
            than two gene prediction programs over most of their length are
            annotated as 'hypothetical' proteins. Genes encoding tRNAs are
```

```
            predicted by tRNAscan-SE (Sean Eddy,
            http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are
            identified by repeatmasker (Arian Smit,
            http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of
            genomic sequence that are not annotated as genes but have predicted
            exons by GRAIL are annotated as misc features.

  TITLE     Direct Submission
  JOURNAL   Submitted (02-JUN-1997) Molecular and Human Genetics, Baylor
            College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
  REMARK    U90127 updated by submitter
COMMENT     On Jun 17, 1997 this sequence version replaced gi:1890297.
            Sequencing is completed to a minimum standard of double strand
            coverage with a minimum of 2 clones and 2 reads with no ambiguities
            or 2 chemistries with a minimum of 2 clones and 3 reads with no
            ambiguities. If the sequence quality does not meet this standard,
            it will be indicated in the annotation.
            The contig containing BAC(GSHB92-B2) was constructed by FMR2 cDNA
            probe hybridization and coding analysis of overlapping clones.
            There are at least 2 overlapping clones for this region.
            The repeat regions shown were identified using RepeatMasker by
            Adrian Smit.
            Sequence similarities were identified using Powerblast by Jinghui
            Zhang.
            Exon/Intron boundaries of identified genes were chosen if there
            were canonical splice junctions that maintained sequence continuity
            across the splice junctions.

COMMENT     IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ232N11  Contig_ID: 01145  acc=  Length:
            8642 bp Unfinished: dJ232N11  Contig_ID: 01307  acc=  Length: 6314

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.
```

```
            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-1, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            Actual start of this clone is at base position 1 of DJ1194E14;
            actual end is at 161453 of DJ1194E14.

COMMENT     On Aug 4, 1998 this sequence version replaced gi:2467105.
            Order of segments is not known; 800 n's separate segments.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc.

COMMENT     On Sep 24, 1998 this sequence version replaced gi:3402800.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: bK407F11  Contig_ID: 03127  acc=AL022329

  TITLE     Characterization of the chicken histone H1 gene complement:
            generation of a complete set of vertebrate H1 protein sequences
  JOURNAL   J. Biol. Chem. 262, 9656-9663 (1987)
  MEDLINE   87250632
COMMENT     Draft entry and clean copy of sequence [1] kindly provided by
            L.S.Coles (09-SEP-1987).
            Comparison of H1 non-coding regions in chickens and other organisms
            reveals conserved sequences in both 5' and 3' ends:  bp 218-229 (H1
            specific); bp 261-272 (g-rich); bp 1054-1078, 1086-1098, 1121-1126
            (histone-specific 3' elements).

  TITLE     Human cholesteryl ester transfer protein gene proximal promoter
            contains dietary cholesterol positive responsive elements and
            mediates expression in small intestine and periphery while
            predominant liver and spleen expression is controlled by 5'-distal
            sequences. Cis-acting sequences mapped in transgenic mice

  TITLE     The ovalbumin gene family: complete sequence and structure of the Y
            gene
  JOURNAL   Nucleic Acids Res. 10 (14), 4363-4382 (1982)
  MEDLINE   83014329
COMMENT     This sequence shows approximately 73% homology with the ovalbumin
            and ovalbumin-x genes. See <chkoval>,<chkx>. Homology is strongest
            and exonic DNA suggesting strong selection pressure for
            conservation. A leader exon and seven exons were determined by
            electron microscopy and comparison with the ovalbumin region.
            Dinucleotide frequencies and purine and pyrimidine stretches are
            reported and discussed.

            CB10 1SA, UK
COMMENT     On Mar 25, 1998 this sequence version replaced gi:2894447.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc.
            For more information about this sequence or the Malaria Project,
            see http://www.sanger.ac.uk/Projects/P_falciparum.

COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=F43D2
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT: This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone F43D2.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F43D2 is at 19281 in
            sequence Z93386.
            The start of this sequence (1. .103) overlaps with the end of
            sequence Z93386.
```

```
            The end of this sequence (27674. .27777) overlaps with the start of
            sequence Z75532.

```
            The Staden databases, finishing information, and all
            chromatographic files used in the assembly of this clone are
            available from our anonymous ftp site.

            All repeats were identified using RepeatMasker: Smit, A.F.A. &
            Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html.

                      St. Louis, MO  63110, USA, and
                      Sanger Centre, Hinxton Hall
                      Cambridge CB10 IRQ, England
                      e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk
                      NEIGHBORING COSMID INFORMATION:
            The 5' end lies in a gap followed by the cosmid ZC411;3' cosmid is
            F59E11.  Actual start of this cosmid is at base position 1 of
            CELT19A5

            NOTES:
```

```
            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

  TITLE     Direct Submission
  JOURNAL   Submitted (01-FEB-1995) Schizosaccharomyces pombe chromosome I
            sequencing project, Sanger Centre, Hinxton Hall, Hinxton, Cambridge
            CB10 1RQ E-mail: barrell@sanger.ac.uk
COMMENT     Notes:
            Details of yeast sequencing at the Sanger Centre are available on
            the World Wide Web.
            (URL, http://www.sanger.ac.uk/yeast/home.html)
            Protein coding regions (CDS) have been predicted with the help of
            computer analysis using the Genefinder program in PomBase (an ACEDB
            database) with additional predictions for the branch-acceptor sites
            supplied by the program Sp3splice. CAUTION: It is possible that for
            any individual CDS we may have underestimated or overestimated the
            number of introns/exons or we may not have chosen the correct
            splice donor/acceptor sites. CDS are numbered using the following
            system eg SPAC5H10.01c. SP (S. pombe), A (chromosome 1), c5H10
            (cosmid name), .01 (first CDS), c (complementary strand).
            The more significant matches with motifs in the PROSITE database
            are also included but some of these may be fortuitous. The length
            in codons is given for each CDS.
            IMPORTANT: This sequence MAY NOT be the entire insert of the
            sequenced clone.  It may be shorter because we only sequence
            overlapping sections once, or longer, because we arrange for a
            small overlap between neighbouring submissions. Cosmid c1D4
            overlapped by c1F3 5' and c22F3 3'.

RESULT 50
LOCUS HSN120B6B 32359 bp DNA PRI 19-AUG-1998
DEFINITION Human DNA sequence from cosmid N120B6 on chromosome 22q12-qter.
ACCESSION Z73988
NID g2193880
KEYWORDS 22q12-qter.
SOURCE human.
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria;
Primates; Catarrhini; Hominidae; Homo.
REFERENCE 1 (bases 1 to 32359)
AUTHORS Hunt,A.
TITLE Direct Submission
JOURNAL Submitted (28-MAY-1997) E-mail enquires: humquery@sanger.ac.uk
Clone requests: clonerequest@sanger.ac.uk
COMMENT On Jun 12, 1997 this sequence version replaced gi:1403048.
IMPORTANT: This sequence is not the entire insert of clone N120B6.
It may be shorter because we only sequence overlapping sections
once, or longer because we arrange for a small overlap between
neighbouring submissions.
This sequence was generated from part of bacterial clone contigs of
human chromosome 22, constructed by the Sanger Centre chromosome 22
mapping group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr22/
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
sequence is ambiguous, there is an annotation using the 'unsure'
feature key.
The sequence from clone N120B6 has been finished in more than one
contig. This sequence (N120B6B) is separated from the preceding one
(N120B6A) by a gap of 150bp sized by restriction analysis.
The true left end of clone N4F11 is at 2151.
The true right end of clone N37D7 is at 19947.
The true right end of clone N120B6 is at 32359.
N120B6 is from the human chromosome 22-specific cosmid library
LL22NCO3, constructed at the Biomedical Sciences Division, Lawrence
Livermore National Laboratory, Livermore, CA 94550 under the

auspices of the National Laboratory Gene Library Project sponsored
by the US Department of Energy. The source of the flow sorted
chromosomes was a human/hamster hybrid containing chromosomes Y, 22
and 9.
VECTOR: Lawrist 16.
N120B6 is part of a cosmid contig isolated using YACs and markers
from the Sanger Centre chromosome 22 YAC contig described in
Collins, J.E. et al Nature 377 Suppl., 367-379.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

              WARNING: There is evidence that suggests that the 384-well parent
              plate of this clone contains both human and mouse derived clones.
              Thus, the origin of this clone is uncertain. This caution should be
              kept in mind should you use this clone.

              This clone is available royalty-free through LLNL ; contact the
              IMAGE Consortium (info@image.llnl.gov) for further information.

/organism="Rattus norvegicus"
/strain="Sprague-Dawley"
/note="Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C2p library is a subtracted library derived from the UI-R-C1

library, which is a subtracted library derived from the UI-R-C0 library. The UI-R-C0 library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C2p) was constructed as follows: PCR amplified cDNA inserts from UI-R-C1 clones from which 3' ESTs had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-C2p library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996)"

Statistics: Mean 6.413; Variance 2.841; scale 2.258

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1012; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Transformed lactic acid bacteria -
PT   using exogenous DNA hich codes enzyme that breaks down
PT   oligosaccharide and/or polysaccharide, used in silage or as a
PT   probiotic
PS   Claim 7; Fig 3a; 112pp; English.
CC   an oligosaccharide and/or a polysaccharide into a fermentable
CC   carbohydrate.
CC   The inventors claim an inoculum for silage which comprises lactic
CC   acid bacteria, esp. Lactobacillus plantarum and E. faecalis, transformed
CC   with an exogenous DNA encoding an enzyme which breaks down an oligosacc-
CC   -haride and/or a polysaccharide into a fermentable carbohydrate. The
CC   exogenous enzyme is especially an alpha-amylase encoded by the DNA
CC   sequence in N91246, particularly from nucleotides 184 to 2131 (Claims 2,
CC   6 and 10). The transformed lactic acid bacteria can break down poly-
```

```
CC   saccharides and oligosaccharides in a silage crop to provide a complete
CC   source of the fermentable carbohydrates that the lactic acid bacteria
CC   need for producing lactic acid. Also claimed is a probiotic characterised
CC   by the transformed lactic acid bacteria which can be used for establish-
CC   -ing and maintaining optimal intestinal flora in animals, including
CC   humans.  A plasmid contg. the DNA sequence in N91248 is claimed.  The
CC   plasmid is pLH1 or pLAB1000.

PT   New constitutive triple response genes and mutants - isolated from
PT   Arabidopsis thaliana, used to produce transgenic plants with
PT   improved properties
PS   Claim 3; Column 37-44; 41pp; English.
CC   Seeds of A. thaliana ecotype Columbia were subjected to X-ray
CC   mutagenesis and screened for mutants that constitutively displayed
CC   the triple response by plating on agar in the absence of added
CC   ethylene in the dark.  Sequence analysis of isolated mutant ctr1-2
CC   genomic DNA (given in Q98818) indicated a 17 bp deletion beginning at
CC   the position corresp. to position 2770 of the wild-type genomic
CC   sequence (Q98817).  Transgenic plants expressing recessive ctr1
CC   mutations resemble ethylene-treated wild-type plants.

PT   Plants over-expressing constitutive triple response gene - resulting
PT   in insensitivity to ethylene which can improve the quality and
PT   longevity of crops e.g. by affecting fruit ripening
PS   Claim 3; Column 37-44; 41pp; English.
CC   The present sequence represents the ctr 1-2 mutation of the constitutive
CC   triple response (CTR) gene. The mutation is a 17bp deletion beginning at
CC   position 1995 of the wild type genomic DNA which is predicted to result
CC   in a frame shift in the coding region, and was produced by X-rays. This
CC   sequence is used to transform plant cells. The plants overexpress the
CC   Arabidopsis thaliana CTR1 gene, which results in insensitivity to
CC   ethylene. This benefits plants in relation to stress such as infection
CC   due to pathogens (i.e. bacteria, viruses and fungi), wound healing and
CC   soil penetration. Since ethylene affects agriculturally important
CC   plant processes, e.g. fruit ripening, flower and leaf senescence and
CC   leaf abscission, the ability to control ethylene sensitivity could
CC   improve the quality and longevity of crops.

PT   Plants over-expressing constitutive triple response gene - resulting
PT   in insensitivity to ethylene which can improve the quality and
PT   longevity of crops e.g. by affecting fruit ripening
PS   Claim 4; Column 43-50; 41pp; English.
CC   The present sequence represents the ctr 1-3 mutation of the constitutive
CC   triple response (CTR) gene. Specifically, a C to T transition results
CC   in a stop codon at position 1927 of the genomic sequence, produced by
CC   ethyl methanesulphonate (EMS). This sequence is used to transform plant
CC   cells. The plants overexpress the Arabidopsis thaliana CTR1 gene, which
CC   results in insensitivity to ethylene. This benefits plants in relation to
CC   stress such as infection due to pathogens (i.e. bacteria, viruses and
CC   fungi), wound healing and soil penetration. Since ethylene affects
CC   various agriculturally important plant processes, e.g. fruit ripening,
CC   flower and leaf senescence and leaf abscission, the ability to control
CC   ethylene sensitivity could improve the quality and longevity of crops.

PT   Plants over-expressing constitutive triple response gene - resulting
PT   in insensitivity to ethylene which can improve the quality and
PT   longevity of crops e.g. by affecting fruit ripening
PS   Claim 8; Column 29-36; 41pp; English.
CC   The present sequence represents the genomic DNA for constitutive triple
CC   response (CTR) gene. The genomic DNA contains 14 introns ranging in size
CC   from 77 bp to 357 bp, and the intron/exon boundaries all fit the
CC   consensus for splice donor and acceptor sites fairly well. This sequence
CC   is used to transform plant cells. The ctr1-5 mutation was produced by
CC   a T-DNA insertion at position 3041 in intron 7 and deletion of 25 bp
CC   from the left border of the T-DNA at the junction with plant DNA. The
```

```
CC   plants overexpress the Arabidopsis thaliana CTR1 gene, which results
CC   in insensitivity to ethylene. This benefits plants in relation to stress
CC   such as infection due to pathogens (i.e. bacteria, viruses and fungi),
CC   wound healing and soil penetration. Since ethylene affects various
CC   agriculturally important plant processes, e.g. fruit ripening, flower
CC   and leaf senescence and leaf abscission, the ability to control ethylene
CC   sensitivity could improve the quality and longevity of crops.

PT   New hybrid molecules for delivery of agents to cells - comprise a
PT   binding domain of a cell binding ligand and a portion of a
PT   translocation domain of a protein
PS   Example 4; Fig 11A-B; 30pp; English.
CC   This sequence comprises the castorbean gene that codes for ricin
CC   (see W25787).  DNA encoding the ricin A domain and a portion
CC   of the ricin A-to-B linker peptide was used to construct a
CC   ricin-diphtheria toxin B'-interleukin-2 gene that was expressed in
CC   E. coli.  The hybrid protein can be isolated and used to treat
CC   conditions involving over-production of cells bearing IL2 receptors,
CC   such as certain T-cell lymphomas and organ transplant rejection
CC   crises.  The hybrid inactivates ribosomes in cells bearing IL2
CC   receptors, resulting in cessation of protein synthesis and death of
CC   target cells.  Claimed hybrid proteins comprise a translocation
CC   domain and a cell binding domain from e.g. a hormone, growth factor
CC   or polypeptide toxin.  The hybrid molecules can be used for the
CC   delivery of agents (e.g. therapeutic genes, toxins, detectable
CC   labels) into cells.  The use of a translocation mechanism ensures
CC   that the hybrid will be effective in relatively low doses, since a
CC   high proportion of the substance of interest will be taken into the
CC   targeted cells.  The hybrid molecules can be manufactured as a
CC   single hybrid recombinant protein, permitting reproducibility,
```

```
CC   consistency, and the precise control of composition.

PT   Interleukin-4 receptor proteins - useful for suppressing immune and
PT   inflammatory responses
PS   Claim 16; Fig4A-C; 47pp; English.
CC   A cDNA clone (T61551), designated T22-8, codes for human
CC   interleukin-4 (IL-4) receptor (W13499).  It was obtd. from a cDNA
CC   library derived from the T cell line T22 using a probe derived from
CC   murine Il-4 receptor cDNA (see also T61550).  IL-4 receptor cDNA
CC   can be used for recombinant prodn. of IL-4 receptor polypeptides
CC   (esp. soluble polypeptides) useful for suppressing IL-4-dependent
CC   immune or inflammatory responses, e.g. for treating allergies,
CC   arthritis or diabetes or for preventing transplant rejection.

PT   Ribozymes having modified bases and methods for producing them  -
PT   for use in inhibiting disease related genes
PS   Claim 2; Page 252; 407pp; English.
CC   The present sequence represents a preferred target sequence for an
CC   enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha
CC   mRNA at the nucleotide base position indicated in the DE line.
CC   Regions of the mRNA that do not form secondary folding
CC   structures and that contain potential hammerhead and hairpin
CC   ribozyme cleavage sites were identified by computer analysis.
CC   Ribozymes directed against these mRNA sequences were designed and
CC   synthesised with modifications that improve their nuclease
CC   resistance. The ribozymes are designed to cleave the target
CC   sequences and thereby inhibit TNF-alpha expression, making them
CC   potentially useful for treating rheumatoid arthritis, septic shock
CC   and other inflammatory disorders including psoriasis, as well as
CC   for treatment of AIDS.

PT   Identifying nucleic acid ligands for target molecules - by
PT   partitioning increased affinity nucleic acids from a candidate
PT   mixt. and amplifying
PS   Claim 37; Fig 34; 251pp; English.
CC   The sequences given in Q88982-91 represent nucleic acid ligands to
CC   vascular endothelial growth factor (VEGF).  These ligands all
CC   contain the consensus sequence given in Q88992.  These ligands were
CC   identified using the method of the invention.  The method comprises
CC   contacting a candidate mixture with the target molecule (i.e. VEGF)
CC   where the nucleic acids which have an increased affinity to the target
CC   relative to the candidate mixture can be partitioned from the remainder
CC   of the candidate mixture.  The increased affinity nucleic acids are
CC   partitioned from the remainder of the candidate mixture and the isolated
CC   nucleic acids are amplified to yield a ligand-enriched mixture of
CC   nucleic acids, in which the nucleic acid ligands can be identified.
CC   The isolated ligands may be used as pharmaceuticals, diagnostic agents
CC   and in gene therapy.  The ligands may be RNA or DNA molecules.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1388; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Novel DNA mols. encoding olfactory receptor (OR) genes - for use in
PT   studying olfactory polymorphism in a population or for detecting
PT   inter-individual differences in OR's or olfactory clusters in humans
PS   Claim 1; Fig 4e; 46pp; English.
CC   Q91400-415 are sequences encoding olfactory receptors from humans.
CC   This sequence is from the gene designated 17-228. The genes were isolated
CC   from a flow-sorted human chromosome library using, as probes, regions of
CC   the human and rat genome amplified by primers Q91416-8, which were
CC   designed on the second and seventh transmembrane region of the rat
CC   olfactory receptor gene sequence. By cosmid mapping the sequences were
CC   shown to be present at chromosome location 17q13, with several as gene
CC   clusters.  The nucleic acid sequences of the receptors can be used as
CC   probes for the study of olfactory receptor polymorphisms in a population
CC   or for detecting inter-individual differences in olfactory receptors or
CC   olfactory clusters. The proteins can be used for probing for the presence
CC   of a certain fragrance, aroma or flavour in a medium by detecting a
CC   signal upon ligand binding on an immobilised protein.

PT   Antibodies specific for urokinase plasminogen activator receptor -
PT   useful for e.g. receptor quantification, drug delivery; inhibition
PT   of receptor-activator binding e.g. in cancer etc.
PS   Disclosure; Columns 99-104; 90pp; English.
CC   Antibodies (Ab) against urokinase plasminogen activator receptors
CC   (u-PAR), e.g. the human u-PAR encoded by the present sequence, are
CC   claimed. The Ab pref. bind the u-PA binding domain of u-PAR, but
CC   not u-PA/u-PAR complexes. Four monoclonal Ab produced by the
CC   hybridomas I 4E-8, I 5A-7, I 10A-4 and II 1D-6, designated ECACC
CC   90101007-10 respectively, are specified.
CC   The Ab can be used to detect/quantify u-PAR, target diagnostic or
CC   therapeutic agents to cells having u-PAR on their surface (e.g.
CC   cancer cells), therapeutically inhibit u-PA/receptor binding,
CC   block local protease activity, screen drugs for their ability to
CC   inhibit u-PA/u-PAR interaction and purify u-PAR by affinity
CC   chromatography.

PT   Recombinant urokinase-type plasminogen activator receptor -
PT   useful for antibody generation e.g. for inhibiting cell surface
PT   plasminogen activation
PS   Disclosure; Page 34-37; 278pp; English.
CC   On the basis of the amino-terminal amino acid sequence of pure
CC   u-PAR, a 24-mer nucleotide probe (Q06355) was synthesized and used to
CC   screen a library to identify and isolate recombinant clones carrying
CC   the cDNA for u-PAR.  The identity of the cDNA clones was confirmed by
CC   comparing the nucleotide sequence with the amino terminal sequence
CC   of the purified u-PAR, and by expressing the cDNA in mouse L cells
CC   and assaying their u-PA-binding activity.  The sequence
CC   represented here is from clone p-uPAR-1.
CC   The inhibition of receptor binding of u-PA as a means of inhibiting
CC   some of its physiological functions has a variety of therapeutic
CC   applicns, e.g.  prevention of invasion and metastasis of cancer cells,
CC   and treatment of inflammatory bowel disease, premalignant colonic
CC   adenomas, septic arthritis, osteoarthritis, rheumatoid arthritis,
CC   osteoporosis, cholesteatoma, corneal ulcers, keratitis,
CC   epidermolysis bullosa, psoriasis and pemphigus.  Since u-PAR are
CC   also present in blood and endothelial cells, their regulation might
CC   also affect intravascular fibrinolytic activity.  A contraceptive
CC   effect is also expected of measures that inhibit receptor binding.
CC   The protein may also be used to treat disorders related to a
CC   reduced amt. or an impaired function of u-PAR, e.g. impaired wound
CC   healing and some cases of thromboembolic disorders.
CC   See also Q06898.

PT   Antibodies to human phospholipase inhibitory protein - useful as
PT   immunoassay reagents
PS   Claim 1; Fig 13A-B; 34pp; English.
CC   This DNA encodes for human phospholipase inhibitory protein (hPIP) having
CC   a defined sequence of 335 amino acids. This protein has a phospholipase
CC   A2 (PA2) inhibiting activity. Pure hPIP can be derived by recombinant
CC   techniques or from the human peritoneal dialysis fluid by various
CC   purification procedures. Antibodies that can react with a hPIP/
CC   apolipoprotein IV (apoAIV) complex are used in immunoassays for
CC   diagnostic and therapy monitoring purposes, in the diagnosis and
CC   treatment of inflammatory conditions.

PT   Human antiinflammatory phospholipase inhibitor protein - obtd. by
PT   purificn. of human inter:peritoneal dialysis fluid
PS   Claim 15; Fig 13; 61pp; English.
CC   Lambda U200 was used to probe cDNA libraries for hPIP. Lambda U200
CC   and lambda U500 share approximately 50 bp at the 5' ends of each and
CC   then diverge. This divergence was due to intron splicing. PHN600 not
CC   only shares the 50 bp segment common to lambda U200 and lambda U500,
CC   but its homology with lambda U500 extends for another approximately
CC   200 bp. These sequences then also diverge. This divergence was shown
CC   to be due to the presence of optional 3' terminal exons in the gene.
CC   pLE-1 contains the full-length coding sequence for hPIP. The hPIP
CC   can be used for producing antibodies (claimed). The PIP proteins
CC   show in vitro activity as phospholipase inihibitors. The proteins are
CC   useful both to control inflammatory responses and to treat
CC   inflammatory disorders.

PT   Purified human phospholipase inhibitor protein - obtd. from
PT   dialysis fluid or by recombinant methods, useful for treating
PT   inflammation, in infection, rheumatoid arthritis, allergy,
PT   injury, etc.
PS   Claim 6; Figure 13; 36pp; English.
CC   The human phospholipase inhibitor protein (hPIP) is capable of
CC   suppressing the production of PGE2 in cell culture and of combating
CC   inflammation in in vivo models.  Applications include treatment of
CC   inflammation due to infection or wounding and treatment of
CC   inflammatory disorders.  Purified hPIP is also useful to prepare
CC   antisera or monoclonal antibodies for immunoassays useful in
CC   diagnosis and in monitoring of therapy.

PT   Monoclonal antibody which binds to the MADER protein - used for
PT   detecting cancerous conditions, such as breast carcinoma
PS   Disclosure; Fig 3; 69pp; English.
CC   The present sequence represents a melanoma associated delayed early
CC   response (MADER) gene, which encodes a novel 55 kDa nuclear protein. This
CC   protein is associated with growth alterations in malignant melanomas and
CC   other cancerous conditions, and is over-expressed in human malignant
CC   melanomas. Several variants of the protein have been identified
CC   (W24228-31), the present seqeunce encoding a variant which binds
```

```
CC   erg-1 and inhibits its activity. Chromosomal rearrangement of MADER can
CC   be detected by hybridising immobilised chromosomal target DNA, that has
CC   been rendered single stranded and is obtained from a cell suspected of
CC   having undergone a MADER translocation event with a single stranded
CC   oligonucleotide probe complementary to a MADER nucleotide sequence. The
CC   probe contains a moiety capable of direct or indirect visualisation.
CC   Antibodies raised against the MADER protein can be used for detecting a
CC   cancerous condition, particularly melanoma malignancies, and especially
CC   a breast carcinoma. A composition comprising a MADER immunogen and a
CC   pharmaceutically acceptable vehicle can be used to elicit an immune
CC   response against a cell which over-expresses a MADER antigen.

PT   Increased secretion of human serum albumin from yeast cells -
PT   using a co-expression system of protein di-sulphide isomerase
PT   gene and protein gene
PS   Example 3; Page 18-23; 51pp; English.
CC   PDI enhances formation of normal disulphide bonds in HSA, and so
CC   assists the formation of the higher order structure of HSA more
CC   efficiently.  Its co-expression with HSA reduces the chance of
CC   association of HSA mols. with unstable structure and their
CC   decomposition by host cell proteases.  The secretion level of HSA
CC   is thus increased, and the PDI-retention efficiency in the
CC   endoplasmic reticulum (ER) is improved in conjuction with a large
CC   scale expression system of a protein localising in the ER of a
CC   eukaryote.

PT   cDNA encoding P107 and its probe - is used for early diagnosis of
PT   tumours resulting from point mutation(s) or specific deletions
PS   Claim 1; Fig 1; 30pp; English.
CC   This represents the p107 cDNA sequence.  This cDNA was isolated using
CC   probes designed using fragments of the p107 amino acid sequence
CC   (see also R30415-17).  The protein p107 is a tumour suppressor gene
CC   product which is involved in cell cycle regulatory activity.  p107
CC   has been shown to be structurally and functionally similar to the RB
CC   protein of the retinoblastoma susceptibilty gene.  p107 binds viral
CC   and cellular proteins at a binding domain designated the "p107 pocket".
CC   The p107 pocket can perform a T-p107 binding function and a E1A-p107
CC   binding function.  RB and p107 proteins show a high degree of homology
CC   around their respective "pockets" but very little homology outside this
CC   region.  The p107 coding sequence has been found to map to 20q 11.2.

PT   Polypeptide fragments and analogues of CD26 and encoding nucleic
PT   acid - useful for stimulating immune response, e.g. for treatment
PT   of AIDS to counteract immunosuppressive drug, and as vaccine
PT   adjuvant.
PS   Disclosure; Page 46-49; 85pp; English.
CC   This sequence encodes the human T cell activation antigen CD26.  The
CC   invention is concerned with polypeptide fragments and analogues of
CC   CD26 which have internal deletions (see also R54612-14).  The
CC   analogues pref. lack residues 3-9 or 24-34.  These analogues are
CC   soluble under physiological conditions and lack enough amino acid
CC   residues to render them susceptible to cleavage by signal peptidase.
CC   The peptide fragments and analogues are useful as immune or response-
CC   stimulating therapeutics, eg. they may be used for treatment of
CC   disease conditions characterised by immunosuppression, eg. AIDS or
CC   AIDS-related complex, other virally or environmentally-induced
CC   conditions, and certain congenital immune deficiencies.  The peptides
CC   can be employed to increase immune function which has been impaired by
CC   use of immunosupressive drugs, such as certain chemotherapeutic drugs.

PT   Polypeptide fragments of CD26 - are capable of disrupting binding
PT   of CD45 and CD26 and thus interfering with T-cell activation
PS   Disclosure; pages 39-43; 73pp; English.
CC   C26 is a human T cell antivation antigen originally identified by
CC   its reactivity with the MAb Ta1. C26 cDNA library was constructed
CC   from human PHA-activated T cells using the CDM7vector.The hydrophobic
CC   N-terminal of the predicted CD26 polypeptide has the characteristics
CC   of a signal sequence of the type II membrane protein, which is
CC   reinforced by the observation that potential N-glycosylation sites
CC   are located in the carboxy side of the hydrophobic core.Therefore
CC   the N-terminal 6 AAs are predicted to be cytoplasmic, the next 22
CC   AAs are predicted to transverse the cytoplasmic membrane, and the
CC   738 C-terminal AAs constitute the predicted extracellular domain.

PT   Isolation and detection of novel DNA encoding proteins which bind to
PT   casein kinase I isoforms - useful in understanding the control of
PT   normal and malignant cell growth.
PS   Claim 24; Page 36-40; 84pp; English.
CC   To identify genes encoding proteins that interact with S. cerevisiae
CC   HHR25 CK1 protein-kinase, a dihybrid screening method was used
CC   in which 'bait' components (CK1 isoforms) were fused to the DNA
CC   binding domain of a transcription factor (lexA protein) and 'prey'
CC   components (putative CK1 interactive proteins) were fused to the
CC   transactivation domain of the transcription factor (GAL4). Fusions
CC   were expressed in hosts containing a reporter gene fused to a LexA DNA
CC   binding site. Prey-bait binding led to transcriptional activation
CC   producing beta-galactosidase activity. Clones TIH1, TIH2 and TIH3
CC   were identified, and full-length genomic clones encoding TIH1-3
CC   (Q99851-53) were isolated from genomic libraries.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
```

```
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            Clone RG370M10 is from a release of the human BAC library
            CITB-HS-A.  The library contains cloned DNA from human sperm.  See:
             Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J.
            Kim et al., Genomics 34:213-8 (1996).  The clone is available from
            Research Genetics, Inc. (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the right is DJ0531J23.  Actual start of
            this clone is at base position 1 of RG370M10; actual end is at
            188205 of RG370M10.

            This clone contains a polymorphic bases with DJ0531J23.
